

# Package ‘ProfileLikelihood’

August 25, 2023

**Version** 1.3

**Date** 2023-08-24

**Title** Profile Likelihood for a Parameter in Commonly Used Statistical Models

**Maintainer** Leena Choi <naturechoi@gmail.com>

**Description** Provides profile likelihoods for a parameter of interest in commonly used statistical models. The models include linear models, generalized linear models, proportional odds models, linear mixed-effects models, and linear models for longitudinal responses fitted by generalized least squares. The package also provides plots for normalized profile likelihoods as well as the maximum profile likelihood estimates and the kth likelihood support intervals.

**License** GPL (>= 3)

**Imports** nlme, MASS

**LazyLoad** yes

**NeedsCompilation** no

**Author** Leena Choi [aut, cre] (<<https://orcid.org/0000-0002-2544-7090>>)

ProfileLikelihood-package

*Profile Likelihood for a Parameter in Commonly Used Statistical Models*

---

## Description

This package provides profile likelihoods for a parameter of interest in commonly used statistical models. The models include linear models, generalized linear models, proportional odds models, linear mixed-effects models, and linear models for longitudinal responses fitted by generalized least squares. The package also provides plots for normalized profile likelihoods as well as the maximum profile likelihood estimates and the kth likelihood support intervals (Royall, 1997).

## Details

Use [profilelike.lm](#), [profilelike.glm](#), [profilelike.polr](#), [profilelike.gls](#) and [profilelike.lme](#) to obtain profile likelihoods and normalized profile likelihoods, and plot the normalized profile likelihoods using [profilelike.plot](#). Use [profilelike.summary](#) to obtain the maximum profile likelihood estimate and the kth likelihood support intervals.

## Examples

```
ctl <- c(4.17,5.58,5.18,6.11,4.50,4.61,5.17,4.53,5.33,5.14)
trt <- c(4.81,4.17,4.41,3.59,5.87,3.83,6.03,4.89,4.32,4.69)
group <- c(rep(0,10), rep(1,10))
weight <- c(ctl, trt)
dd <- data.frame(group=group, weight=weight)
xx <- profilelike.lm(formula = weight ~ 1, data=dd, profile.theta="group",
  lo.theta=-2, hi.theta=1, length=500)
profilelike.plot(theta=xx$theta, profile.lik.norm=xx$profile.lik.norm, round=2)
```

---

`dataglm`*Example Data for a Profile Likelihood in Generalized Linear Models*

---

**Description**

This data is used to illustrate how to obtain values for a profile likelihood of a parameter of interest in a generalized linear model.

**Usage**

```
data(dataglm)
```

**Format**

A data frame with 100 observations on the following 5 variables.

`id` a numeric vector; unique identification number

`y` a numeric vector; binary outcome variable

`x1` a numeric vector; covariate

`x2` a numeric vector; covariate

`group` a numeric vector; covariate and a parameter of interest

**Details**

This data is used to illustrate how to obtain values for a profile likelihood of a parameter of interest in a logistic regression model. A parameter of interest is `group` indicator variable, `y` is a binary outcome, and `x1` and `x2` are covariates in a logistic regression model.

**Examples**

```
data(dataglm)
xx <- profilelike.glm(y ~ x1 + x2, data=dataglm, profile.theta="group",
family=binomial(link="logit"), length=500, round=2)
profilelike.plot(theta=xx$theta, profile.lik.norm=xx$profile.lik.norm, round=2)
```

---

`datapolr`*Example Data for a Profile Likelihood in Proportional Odds Models*

---

**Description**

This data is used to illustrate how to obtain values for a profile likelihood of a parameter of interest in a proportional odds model.

**Usage**

```
data(datapolr)
```

**Format**

A data frame with 66 observations on the following 5 variables.

id a numeric vector; unique identification number

y a numeric vector; ordinal outcome variable; should be defined as a factor

x1 a numeric vector; covariate

x2 a numeric vector; covariate

group a numeric vector; covariate and a parameter of interest

**Details**

This data is used to illustrate how to obtain values for a profile likelihood of a parameter of interest in a proportional odds model. A parameter of interest is group indicator variable, y is an ordinal outcome, and x1 and x2 are covariates in a proportional odds model.

**Examples**

```
data(datapolr)
datapolr$y <- as.factor(datapolr$y)
xx <- profilelike.polr(y ~ x1 + x2, data=datapolr, profile.theta="group",
method="logistic", lo.theta=-2, hi.theta=2.5, length=500)
profilelike.plot(theta=xx$theta, profile.lik.norm=xx$profile.lik.norm, round=2)
```

---

LR.pvalue

*P-values based on LR statistics for 2 x 2 Tables*

---

**Description**

This function provides p-values based on likelihood ratio (LR) statistics for 2 x 2 tables.

**Usage**

```
LR.pvalue(y1, y2, n1, n2, interval=0.01)
```

**Arguments**

y1	the number of success for treatment 1.
y2	the number of success for treatment 2.
n1	the sample size for treatment 1.
n2	the sample size for treatment 2.
interval	grid for evaluating a parameter of interest to obtain values for likelihoods. The default is 0.01.

**Details**

This function provides p-values based on the profile and conditional likelihood ratio (LR) statistics for 2 x 2 tables. The function also provides the profile and conditional likelihood support intervals (k=6.8) corresponding to a 95% confidence interval based on a normal approximation. For comparison purpose, p-values from Pearson's Chi-squared test, Fisher's exact test and Pearson's Chi-squared test with continuity correction are also provided.

**Value**

<code>mle.lor.uncond</code>	the maximum likelihood estimate for log odds ratio.
<code>mle.lor.cond</code>	the maximum conditional likelihood estimate for log odds ratio.
<code>LI.norm.profile</code>	profile likelihood support interval (k=6.8) corresponding to a 95% confidence interval based on a normal approximation.
<code>LI.norm.cond</code>	conditional likelihood support interval (k=6.8) corresponding to a 95% confidence interval based on a normal approximation.
<code>LR.profile</code>	profile likelihood ratio.
<code>LR.cond</code>	conditional likelihood ratio.
<code>Pvalue.LR.profile</code>	p-value based on the profile LR statistic.
<code>Pvalue.LR.cond</code>	p-value based on the conditional LR statistic.
<code>Pvalue.chisq.test</code>	p-value from Pearson's Chi-squared test.
<code>Pvalue.fisher.test</code>	p-value from Fisher's exact test.
<code>Pvalue.chisq.cont.correction</code>	p-value from Pearson's Chi-squared test with continuity correction.

**Warning**

Likelihood intervals, LRs and the corresponding p-values are not reliable with empty cells ( $y_1=0$  or  $y_2=0$ ) in 2 x 2 tables.

P-values from Pearson's Chi-squared test, Fisher's exact test and Pearson's Chi-squared test with continuity correction are provided only for comparison purpose. For more options, use [chisq.test](#) and [fisher.test](#) for these tests.

**Author(s)**

Leena Choi <naturechoi@gmail.com>

**See Also**

[profilelike.plot](#), [profilelike.summary](#), [profilelike.glm](#)

**Examples**

```
(fit <- LR.pvalue(y1=20, y2=30, n1=50, n2=50, interval=0.01))
```

---

profilelike.glm	<i>Profile Likelihood for Generalized Linear Models</i>
-----------------	---

---

**Description**

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a generalized linear model.

**Usage**

```
profilelike.glm(formula, data, profile.theta, family = stats::gaussian,
  offset.glm = NULL, lo.theta = NULL, hi.theta = NULL, length = 300,
  round = 2, subset = NULL, weights = NULL, offset = NULL, ...)
```

**Arguments**

formula	see corresponding documentation in <a href="#">glm</a> .
data	a data frame. See corresponding documentation in <a href="#">glm</a> .
profile.theta	a parameter of interest, theta; must be a numeric variable.
family	see corresponding documentation in <a href="#">glm</a> .
offset.glm	same usage as offset in <a href="#">glm</a> . See corresponding documentation for offset in <a href="#">glm</a> .
lo.theta	lower bound for a parameter of interest to obtain values for a profile likelihood.
hi.theta	upper bound for a parameter of interest to obtain values for a profile likelihood.
length	length of numerical grid values for a parameter of interest to obtain values for a profile likelihood.
round	the number of decimal places for <a href="#">round</a> function to automatically define lower and upper bounds of numerical grid for a parameter of interest. If an automatically defined parameter range is not appropriate, increase the number or specify lo.theta and hi.theta.
subset	should not be provided.
weights	should not be provided.
offset	should not be provided. Instead use offset.glm.
...	further arguments passed to or from other methods.

**Details**

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a generalized linear model. Users must define a parameter of interest in a generalized linear model. This function can be used for generalized linear models comparable with the [glm](#) function. However, arguments weights, subset, and offset should not be provided. An argument offset in [glm](#) function can be provided using offset.glm. A normalized profile likelihood is obtained by a profile likelihood being divided by the maximum value of the profile likelihood so that a normalized profile likelihood ranges from 0 to 1.

**Value**

theta numerical grid values for a parameter of interest in a specified range (between lower and upper bounds).

profile.lik numerical values for a profile likelihood corresponding to theta in a specified range (between lower and upper bounds).

profile.lik.norm numerical values for a normalized profile likelihood ranging from 0 to 1.

**Warning**

Arguments weights, subset, and offset in the `glm` function are not comparable.  
Missing values should be removed.

[profilelike.lme](#), [glm](#)

**Examples**

```
data(dataglm)
xx <- profilelike.glm(y ~ x1 + x2, data=dataglm, profile.theta="group",
family=binomial(link="logit"), length=500, round=2)
profilelike.plot(theta=xx$theta, profile.lik.norm=xx$profile.lik.norm, round=2)
```

---

profilelike.gls *Profile Likelihood for Linear Models for Longitudinal Responses Fitted by Generalized Least Squares*

---

**Description**

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a linear model for longitudinal responses fitted by generalized least squares.

**Usage**

```
profilelike.gls(formula, data, correlation = NULL, subject, profile.theta,
method = "ML", lo.theta, hi.theta, length = 300, round = 2,
subset = NULL, weights = NULL, ...)
```

**Arguments**

formula	see corresponding documentation in <a href="#">glS</a> .
data	a data frame. See corresponding documentation in <a href="#">glS</a> .
correlation	see corresponding documentation in <a href="#">glS</a> .
subject	see corresponding documentation in <a href="#">glS</a> .
profile.theta	a parameter of interest, theta; must be a numeric variable.
method	see corresponding documentation in <a href="#">glS</a> .
lo.theta	lower bound for a parameter of interest to obtain values for a profile likelihood.
hi.theta	upper bound for a parameter of interest to obtain values for a profile likelihood.
length	length of numerical grid values for a parameter of interest to obtain values for a profile likelihood.
round	the number of decimal places for <a href="#">round</a> function to automatically define lower and upper bounds of numerical grid for a parameter of interest. If an automatically defined parameter range is not appropriate, increase the number or specify lo.theta and hi.theta.
subset	should not be provided.
weights	should not be provided.
...	further arguments passed to or from other methods.

**Details**

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a linear model for longitudinal responses fitted by generalized least squares. Users must define a parameter of interest in the model. This function can be used for models for longitudinal responses comparable with the [glS](#) function. However, arguments weights and subset should not be provided. A normalized profile likelihood is obtained by a profile likelihood being divided by the maximum value of the profile likelihood so that a normalized profile likelihood ranges from 0 to 1.

**Value**

theta	numerical grid values for a parameter of interest in a specified range (between lower and upper bounds).
profile.lik	numerical values for a profile likelihood corresponding to theta in a specified range (between lower and upper bounds).
profile.lik.norm	numerical values for a normalized profile likelihood ranging from 0 to 1.

**Warning**

Arguments weights and subset in the [glS](#) function are not comparable.

Missing values should be removed.

xx <- profilelike.gls(formula=yield ~ endpoint, correlation=nlme::corAR1(form = ~ 1 | id),
  data=Gasoline, subject="Sample", profile.theta="vapor", method="ML",
  lo.theta=1, hi.theta=5, length=500, round=2)
profilelike.plot(theta=xx$theta, profile.lik.norm=xx$profile.lik.norm, round=4)
```

---

profilelike.lm

*Profile Likelihood for Linear Models*

---

**Description**

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a linear model.

**Usage**

```
profilelike.lm(formula, data, profile.theta, lo.theta = NULL, hi.theta = NULL,
  length = 300, round = 2, subset = NULL, weights = NULL, offset = NULL, ...)
```

**Arguments**

formula	see corresponding documentation in <a href="#">lm</a> .
data	a data frame. See corresponding documentation in <a href="#">lm</a> .
profile.theta	a parameter of interest, theta; must be a numeric variable.
lo.theta	lower bound for a parameter of interest to obtain values for a profile likelihood.
hi.theta	upper bound for a parameter of interest to obtain values for a profile likelihood.
length	length of numerical grid values for a parameter of interest to obtain values for a profile likelihood.
round	the number of decimal places for <a href="#">round</a> function to automatically define lower and upper bounds of numerical grid for a parameter of interest. If an automatically defined parameter range is not appropriate, increase the number or specify lo.theta and hi.theta.
subset	should not be provided.
weights	should not be provided.
offset	should not be provided.
...	further arguments passed to or from other methods.

**Details**

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a linear model. Users must define a parameter of interest in a linear model. This function can be used for linear models comparable with the `lm` function. However, arguments `weights`, `subset`, and `offset` should not be provided. A normalized profile likelihood is obtained by a profile likelihood being divided by the maximum value of the profile likelihood so that a normalized profile likelihood ranges from 0 to 1.

**Value**

<code>theta</code>	numerical grid values for a parameter of interest in a specified range (between lower and upper bounds).
<code>profile.lik</code>	numerical values for a profile likelihood corresponding to <code>theta</code> in a specified range (between lower and upper bounds).
<code>profile.lik.norm</code>	numerical values for a normalized profile likelihood ranging from 0 to 1.

**Warning**

Arguments `weights`, `subset`, and `offset` in the `lm` function are not comparable.  
Missing values should be removed.

```

---

profilelike.lme      *Profile Likelihood for Linear Mixed-Effects Models*

---

### Description

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a linear mixed-effects model.

### Usage

```
profilelike.lme(formula, data, subject, random, correlation = NULL,  
profile.theta, method = "ML", lo.theta, hi.theta, length = 300,  
round = 2, subset = NULL, weights = NULL, ...)
```

### Arguments

formula	see corresponding documentation in <a href="#">lme</a> .
data	a data frame. See corresponding documentation in <a href="#">lme</a> .
subject	see corresponding documentation in <a href="#">lme</a> .
random	see corresponding documentation in <a href="#">lme</a> .
correlation	see corresponding documentation in <a href="#">lme</a> .
profile.theta	a parameter of interest, theta; must be a numeric variable.
method	see corresponding documentation in <a href="#">lme</a> .
lo.theta	lower bound for a parameter of interest to obtain values for a profile likelihood.
hi.theta	upper bound for a parameter of interest to obtain values for a profile likelihood.
length	length of numerical grid values for a parameter of interest to obtain values for a profile likelihood.
round	the number of decimal places for <a href="#">round</a> function to automatically define lower and upper bounds of numerical grid for a parameter of interest. If an automatically defined parameter range is not appropriate, increase the number or specify lo.theta and hi.theta.
subset	should not be provided.
weights	should not be provided.
...	further arguments passed to or from other methods.

### Details

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a linear mixed-effects model. Users must define a parameter of interest in a linear mixed-effects model. This function can be used for models comparable with the [lme](#) function. However, arguments weights and subset should not be provided. A normalized profile likelihood is obtained by a profile likelihood being divided by the maximum value of the profile likelihood so that a normalized profile likelihood ranges from 0 to 1.

**Value**

theta	numerical grid values for a parameter of interest in a specified range (between lower and upper bounds).
profile.lik	numerical values for a profile likelihood corresponding to theta in a specified range (between lower and upper bounds).
profile.lik.norm	numerical values for a normalized profile likelihood ranging from 0 to 1.

**Warning**

Arguments weights and subset in the `lme` function are not comparable.  
Missing values should be removed.

```

---

profilelike.plot

*Profile Likelihood Plot*

---

**Description**

The function provides a plot for a normalized profile likelihood as well as the maximum profile likelihood estimate and the kth likelihood support intervals (Royall, 1997).

**Usage**

```
profilelike.plot(theta = theta, profile.lik.norm = profile.lik.norm, round = 2)
```

**Arguments**

theta	numerical grid values for a parameter of interest in a specified range.
profile.lik.norm	numerical values for a normalized profile likelihood ranging from 0 to 1.
round	the number of decimal places for <code>round</code> function for presentation of the maximum profile likelihood estimate and the kth likelihood support intervals.

**Details**

The function provides a plot for a normalized profile likelihood obtained from `profilelike.lm`, `profilelike.glm`, `profilelike.polr`, `profilelike.gls` and `profilelike.lme`. The maximum profile likelihood estimate, the kth likelihood support interval (k=8, k=20, and k=32), and the likelihood support interval (k=6.8) corresponding to a 95% confidence interval based on a normal approximation are also presented.

**Value**

A normalized profile likelihood plot with the maximum profile likelihood estimate and the kth likelihood support intervals.

---

profilelike.polr      *Profile Likelihood for Proportional Odds Models*

---

### Description

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a proportional odds model.

### Usage

```
profilelike.polr(formula, data, profile.theta, method = "logistic",
  lo.theta = NULL, hi.theta = NULL, length = 300, round = 2,
  subset = NULL, weights = NULL, offset = NULL, ...)
```

### Arguments

formula	see corresponding documentation in <a href="#">polr</a> .
data	a data frame. See corresponding documentation in <a href="#">polr</a> .
profile.theta	a parameter of interest, theta; must be a numeric variable.
method	see corresponding documentation in <a href="#">polr</a> .
lo.theta	lower bound for a parameter of interest to obtain values for a profile likelihood.
hi.theta	upper bound for a parameter of interest to obtain values for a profile likelihood.
length	length of numerical grid values for a parameter of interest to obtain values for a profile likelihood.
round	the number of decimal places for <a href="#">round</a> function to automatically define lower and upper bounds of numerical grid for a parameter of interest. If an automatically defined parameter range is not appropriate, increase the number or specify lo.theta and hi.theta.
subset	should not be provided.
weights	should not be provided.
offset	should not be provided.
...	further arguments passed to or from other methods.

### Details

This function provides values for a profile likelihood and a normalized profile likelihood for a parameter of interest in a proportional odds model. Users must define a parameter of interest in a proportional odds model. This function can be used for proportional odds models comparable with the [polr](#) function. However, arguments weights, subset, and offset should not be provided. A normalized profile likelihood is obtained by a profile likelihood being divided by the maximum value of the profile likelihood so that a normalized profile likelihood ranges from 0 to 1.

**Value**

theta	numerical grid values for a parameter of interest in a specified range (between lower and upper bounds).
profile.lik	numerical values for a profile likelihood corresponding to theta in a specified range (between lower and upper bounds).
profile.lik.norm	numerical values for a normalized profile likelihood ranging from 0 to 1.

**Warning**

Arguments weights, subset, and offset in the `polr` function are not comparable.  
Missing values should be removed.

profilelike.plot(theta=xx$theta, profile.lik.norm=xx$profile.lik.norm, round=2)
```

---

profilelike.summary     *Summary for the Maximum Profile Likelihood Estimate and Likelihood Support Intervals*

---

**Description**

The function provides the maximum profile likelihood estimate and likelihood support intervals (Royall, 1997).

**Usage**

```
profilelike.summary(k, theta = theta, profile.lik.norm = profile.lik.norm,
round = 2)
```

**Arguments**

<code>k</code>	strength of evidence for the <code>k</code> th likelihood support interval.
<code>theta</code>	numerical grid values for a parameter of interest in a specified range.
<code>profile.lik.norm</code>	numerical values for a normalized profile likelihood ranging from 0 to 1.
<code>round</code>	the number of decimal places for <code>round</code> function for presentation of the maximum profile likelihood estimate and the <code>k</code> th likelihood support intervals.

**Details**

The function provides the maximum profile likelihood estimate and likelihood support intervals for a profile likelihood obtained from `profilelike.lm`, `profilelike.glm`, `profilelike.polr`, `profilelike.gls` and `profilelike.lme`. The `k`th likelihood support interval and the likelihood support interval (`k=6.8`) corresponding to a 95% confidence interval based on a normal approximation are provided.

**Value**

<code>k</code>	strength of evidence for the <code>k</code> th likelihood support interval.
<code>mle</code>	the maximum profile likelihood estimate.
<code>LI.k</code>	the <code>k</code> th likelihood support interval.
<code>LI.norm</code>	likelihood support interval ( <code>k=6.8</code> ) corresponding to a 95% confidence interval based on a normal approximation.
