

Package ‘paws.compute’

September 12, 2024

Title 'Amazon Web Services' Compute Services

Version 0.7.0

Description Interface to 'Amazon Web Services' compute services, including 'Elastic Compute Cloud' ('EC2'), 'Lambda' functions-as-a-service, containers, batch processing, and more <<https://aws.amazon.com/>>.

License Apache License (>= 2.0)

apprunner

AWS App Runner

Description

App Runner

App Runner is an application service that provides a fast, simple, and cost-effective way to go directly from an existing container image or source code to a running service in the Amazon Web Services Cloud in seconds. You don't need to learn new technologies, decide which compute service to use, or understand how to provision and configure Amazon Web Services resources.

App Runner connects directly to your container registry or source code repository. It provides an automatic delivery pipeline with fully managed operations, high performance, scalability, and security.

For more information about App Runner, see the [App Runner Developer Guide](#). For release information, see the [App Runner Release Notes](#).

To install the Software Development Kits (SDKs), Integrated Development Environment (IDE) Toolkits, and command line tools that you can use to access the API, see [Tools for Amazon Web Services](#).

Endpoints

For a list of Region-specific endpoints that App Runner supports, see [App Runner endpoints and quotas](#) in the *Amazon Web Services General Reference*.

Usage

```
apprunner(  
  config = list(),  
  credentials = list(),  
  endpoint = NULL,  
  region = NULL  
)
```

Arguments

- `config` Optional configuration of credentials, endpoint, and/or region.
- **credentials:**
 - **creds:**
 - * **access_key_id:** AWS access key ID
 - * **secret_access_key:** AWS secret access key
 - * **session_token:** AWS temporary session token
 - **profile:** The name of a profile to use. If not given, then the default profile is used.
 - **anonymous:** Set anonymous credentials.
 - **endpoint:** The complete URL to use for the constructed client.

- **region:** The AWS Region used in instantiating the client.
- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to true to force the request to use path-style addressing, i.e. `http://s3.amazonaws.com/BUCKET/KEY`.
- **sts_regional_endpoint:** Set sts regional endpoint resolver to regional or legacy <https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html>

credentials Optional credentials shorthand for the config parameter

- **creds:**
 - **access_key_id:** AWS access key ID
 - **secret_access_key:** AWS secret access key
 - **session_token:** AWS temporary session token
- **profile:** The name of a profile to use. If not given, then the default profile is used.
- **anonymous:** Set anonymous credentials.

endpoint Optional shorthand for complete URL to use for the constructed client.

region Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- apprunner(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
```

```

credentials = list(
  creds = list(
    access_key_id = "string",
    secret_access_key = "string",
    session_token = "string"
  ),
  profile = "string",
  anonymous = "logical"
),
endpoint = "string",
region = "string"
)

```

Operations

associate_custom_domain	Associate your own domain name with the App Runner subdomain URL of your application
create_auto_scaling_configuration	Create an App Runner automatic scaling configuration resource
create_connection	Create an App Runner connection resource
create_observability_configuration	Create an App Runner observability configuration resource
create_service	Create an App Runner service
create_vpc_connector	Create an App Runner VPC connector resource
create_vpc_ingress_connection	Create an App Runner VPC Ingress Connection resource
delete_auto_scaling_configuration	Delete an App Runner automatic scaling configuration resource
delete_connection	Delete an App Runner connection
delete_observability_configuration	Delete an App Runner observability configuration resource
delete_service	Delete an App Runner service
delete_vpc_connector	Delete an App Runner VPC connector resource
delete_vpc_ingress_connection	Delete an App Runner VPC Ingress Connection resource that's associated with an App Runner service
describe_auto_scaling_configuration	Return a full description of an App Runner automatic scaling configuration resource
describe_custom_domains	Return a description of custom domain names that are associated with an App Runner service
describe_observability_configuration	Return a full description of an App Runner observability configuration resource
describe_service	Return a full description of an App Runner service
describe_vpc_connector	Return a description of an App Runner VPC connector resource
describe_vpc_ingress_connection	Return a full description of an App Runner VPC Ingress Connection resource
disassociate_custom_domain	Disassociate a custom domain name from an App Runner service
list_auto_scaling_configurations	Returns a list of active App Runner automatic scaling configurations in your Amazon Web Services account
list_connections	Returns a list of App Runner connections that are associated with your Amazon Web Services account
list_observability_configurations	Returns a list of active App Runner observability configurations in your Amazon Web Services account
list_operations	Return a list of operations that occurred on an App Runner service
list_services	Returns a list of running App Runner services in your Amazon Web Services account
list_services_for_auto_scaling_configuration	Returns a list of the associated App Runner services using an auto scaling configuration
list_tags_for_resource	List tags that are associated with for an App Runner resource
list_vpc_connectors	Returns a list of App Runner VPC connectors in your Amazon Web Services account
list_vpc_ingress_connections	Return a list of App Runner VPC Ingress Connections in your Amazon Web Services account
pause_service	Pause an active App Runner service
resume_service	Resume an active App Runner service
start_deployment	Initiate a manual deployment of the latest commit in a source code repository
tag_resource	Add tags to, or update the tag values of, an App Runner resource

untag_resource	Remove tags from an App Runner resource
update_default_auto_scaling_configuration	Update an auto scaling configuration to be the default
update_service	Update an App Runner service
update_vpc_ingress_connection	Update an existing App Runner VPC Ingress Connection resource

Examples

```
## Not run:
svc <- apprunner()
svc$associate_custom_domain(
  Foo = 123
)

## End(Not run)
```

batch

AWS Batch

Description

Batch

Using Batch, you can run batch computing workloads on the Amazon Web Services Cloud. Batch computing is a common means for developers, scientists, and engineers to access large amounts of compute resources. Batch uses the advantages of the batch computing to remove the undifferentiated heavy lifting of configuring and managing required infrastructure. At the same time, it also adopts a familiar batch computing software approach. You can use Batch to efficiently provision resources, and work toward eliminating capacity constraints, reducing your overall compute costs, and delivering results more quickly.

As a fully managed service, Batch can run batch computing workloads of any scale. Batch automatically provisions compute resources and optimizes workload distribution based on the quantity and scale of your specific workloads. With Batch, there's no need to install or manage batch computing software. This means that you can focus on analyzing results and solving your specific problems instead.

Usage

```
batch(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **credentials:**

- **creds:**

	<ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- batch(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
```

```

    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)

```

Operations

cancel_job	Cancels a job in an Batch job queue
create_compute_environment	Creates an Batch compute environment
create_job_queue	Creates an Batch job queue
create_scheduling_policy	Creates an Batch scheduling policy
delete_compute_environment	Deletes an Batch compute environment
delete_job_queue	Deletes the specified job queue
delete_scheduling_policy	Deletes the specified scheduling policy
deregister_job_definition	Deregisters an Batch job definition
describe_compute_environments	Describes one or more of your compute environments
describe_job_definitions	Describes a list of job definitions
describe_job_queues	Describes one or more of your job queues
describe_jobs	Describes a list of Batch jobs
describe_scheduling_policies	Describes one or more of your scheduling policies
get_job_queue_snapshot	Provides a list of the first 100 RUNNABLE jobs associated to a single job queue
list_jobs	Returns a list of Batch jobs
list_scheduling_policies	Returns a list of Batch scheduling policies
list_tags_for_resource	Lists the tags for an Batch resource
register_job_definition	Registers an Batch job definition
submit_job	Submits an Batch job from a job definition
tag_resource	Associates the specified tags to a resource with the specified resourceArn
terminate_job	Terminates a job in a job queue
untag_resource	Deletes specified tags from an Batch resource
update_compute_environment	Updates an Batch compute environment
update_job_queue	Updates a job queue
update_scheduling_policy	Updates a scheduling policy

Examples

```
## Not run:
svc <- batch()
# This example cancels a job with the specified job ID.
svc$cancel_job(
  jobId = "1d828f65-7a4d-42e8-996d-3b900ed59dc4",
  reason = "Cancelling job."
)

## End(Not run)
```

braket

Braket

Description

The Amazon Braket API Reference provides information about the operations and structures supported in Amazon Braket.

Additional Resources:

- [Amazon Braket Developer Guide](#)

Usage

```
braket(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config Optional configuration of credentials, endpoint, and/or region.

- **credentials:**
 - **creds:**
 - * **access_key_id:** AWS access key ID
 - * **secret_access_key:** AWS secret access key
 - * **session_token:** AWS temporary session token
 - **profile:** The name of a profile to use. If not given, then the default profile is used.
 - **anonymous:** Set anonymous credentials.
- **endpoint:** The complete URL to use for the constructed client.
- **region:** The AWS Region used in instantiating the client.
- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.

	<ul style="list-style-type: none"> • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- braket(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    )
  )
)
```

```

    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)

```

Operations

cancel_job	Cancel an Amazon Braket job
cancel_quantum_task	Cancel the specified task
create_job	Creates an Amazon Braket job
create_quantum_task	Creates a quantum task
get_device	Retrieves the devices available in Amazon Braket
get_job	Retrieves the specified Amazon Braket job
get_quantum_task	Retrieves the specified quantum task
list_tags_for_resource	Shows the tags associated with this resource
search_devices	Searches for devices using the specified filters
search_jobs	Searches for Amazon Braket jobs that match the specified filter values
search_quantum_tasks	Searches for tasks that match the specified filter values
tag_resource	Add a tag to the specified resource
untag_resource	Remove tags from a resource

Examples

```

## Not run:
svc <- braket()
svc$cancel_job(
  Foo = 123
)

## End(Not run)

```

Description

Compute Optimizer is a service that analyzes the configuration and utilization metrics of your Amazon Web Services compute resources, such as Amazon EC2 instances, Amazon EC2 Auto Scaling groups, Lambda functions, Amazon EBS volumes, and Amazon ECS services on Fargate. It reports whether your resources are optimal, and generates optimization recommendations to reduce the cost

and improve the performance of your workloads. Compute Optimizer also provides recent utilization metric data, in addition to projected utilization metric data for the recommendations, which you can use to evaluate which recommendation provides the best price-performance trade-off. The analysis of your usage patterns can help you decide when to move or resize your running resources, and still meet your performance and capacity requirements. For more information about Compute Optimizer, including the required permissions to use the service, see the [Compute Optimizer User Guide](#).

Usage

```
computeoptimizer(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **credentials:**

- **creds:**

- * **access_key_id:** AWS access key ID
- * **secret_access_key:** AWS secret access key
- * **session_token:** AWS temporary session token

- **profile:** The name of a profile to use. If not given, then the default profile is used.

- **anonymous:** Set anonymous credentials.

- **endpoint:** The complete URL to use for the constructed client.

- **region:** The AWS Region used in instantiating the client.

- **close_connection:** Immediately close all HTTP connections.

- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.

- **s3_force_path_style:** Set this to `true` to force the request to use path-style addressing, i.e. `http://s3.amazonaws.com/BUCKET/KEY`.

- **sts_regional_endpoint:** Set sts regional endpoint resolver to regional or legacy <https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html>

`credentials` Optional credentials shorthand for the `config` parameter

- **creds:**

- **access_key_id:** AWS access key ID
- **secret_access_key:** AWS secret access key
- **session_token:** AWS temporary session token

- **profile:** The name of a profile to use. If not given, then the default profile is used.

- **anonymous:** Set anonymous credentials.
- endpoint Optional shorthand for complete URL to use for the constructed client.
- region Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- computeoptimizer(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

[delete_recommendation_preferences](#)
[describe_recommendation_export_jobs](#)
[export_auto_scaling_group_recommendations](#)

Deletes a recommendation preference, such as enhanced infrastructure.
 Describes recommendation export jobs created in the last seven days.
 Exports optimization recommendations for Auto Scaling groups.

<code>export_ebs_volume_recommendations</code>	Exports optimization recommendations for Amazon EBS volumes
<code>export_ec2_instance_recommendations</code>	Exports optimization recommendations for Amazon EC2 instances
<code>export_ecs_service_recommendations</code>	Exports optimization recommendations for Amazon ECS services on
<code>export_lambda_function_recommendations</code>	Exports optimization recommendations for Lambda functions
<code>export_license_recommendations</code>	Export optimization recommendations for your licenses
<code>export_rds_database_recommendations</code>	Export optimization recommendations for your Amazon Relational D
<code>get_auto_scaling_group_recommendations</code>	Returns Auto Scaling group recommendations
<code>get_ebs_volume_recommendations</code>	Returns Amazon Elastic Block Store (Amazon EBS) volume recomm
<code>get_ec2_instance_recommendations</code>	Returns Amazon EC2 instance recommendations
<code>get_ec2_recommendation_projected_metrics</code>	Returns the projected utilization metrics of Amazon EC2 instance rec
<code>get_ecs_service_recommendation_projected_metrics</code>	Returns the projected metrics of Amazon ECS service recommendati
<code>get_ecs_service_recommendations</code>	Returns Amazon ECS service recommendations
<code>get_effective_recommendation_preferences</code>	Returns the recommendation preferences that are in effect for a given
<code>get_enrollment_status</code>	Returns the enrollment (opt in) status of an account to the Compute C
<code>get_enrollment_statuses_for_organization</code>	Returns the Compute Optimizer enrollment (opt-in) status of organiz
<code>get_lambda_function_recommendations</code>	Returns Lambda function recommendations
<code>get_license_recommendations</code>	Returns license recommendations for Amazon EC2 instances that run
<code>get_rds_database_recommendation_projected_metrics</code>	Returns the projected metrics of Amazon RDS recommendations
<code>get_rds_database_recommendations</code>	Returns Amazon RDS recommendations
<code>get_recommendation_preferences</code>	Returns existing recommendation preferences, such as enhanced infr
<code>get_recommendation_summaries</code>	Returns the optimization findings for an account
<code>put_recommendation_preferences</code>	Creates a new recommendation preference or updates an existing rec
<code>update_enrollment_status</code>	Updates the enrollment (opt in and opt out) status of an account to th

Examples

```
## Not run:
svc <- computeoptimizer()
svc$delete_recommendation_preferences(
  Foo = 123
)

## End(Not run)
```

ec2

Amazon Elastic Compute Cloud

Description

You can access the features of Amazon Elastic Compute Cloud (Amazon EC2) programmatically. For more information, see the [Amazon EC2 Developer Guide](#).

Usage

```
ec2(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ec2(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
```

```

        secret_access_key = "string",
        session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
),
endpoint = "string",
region = "string",
close_connection = "logical",
timeout = "numeric",
s3_force_path_style = "logical",
sts_regional_endpoint = "string"
),
credentials = list(
    creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
),
endpoint = "string",
region = "string"
)

```

Accepts an Elastic IP address transfer
 Accepts the Convertible Reserved Instance exchange quote
 Accepts a request to associate subnets with a transit gateway
 Accepts a transit gateway peering attachment request
 Accepts a request to attach a VPC to a transit gateway
 Accepts connection requests to your VPC endpoint
 Accepts connection requests to your VPC endpoint
 Accept a VPC peering connection request
 Advertises an IPv4 or IPv6 address range that is not in your VPC
 Allocates an Elastic IP address to your Amazon account
 Allocates a Dedicated Host to your account
 Allocate a CIDR from an IPAM pool
 Applies a security group to the association between a transit gateway and a VPC
 Assigns one or more IPv6 addresses to the specified VPC
 Assigns one or more secondary private IP addresses to the specified VPC
 Assigns private IPv4 addresses to a private NAT gateway
 Associates an Elastic IP address, or carrier IP address, with a VPC
 Associates a target network with a Client VPN endpoint
 Associates a set of DHCP options (that you've previously created) with a VPC
 Associates an Identity and Access Management (IAM) role with a VPC
 Associates an IAM instance profile with a running instance

associate_instance_event_window	Associates one or more targets with an event window
associate_ipam_byoasn	Associates your Autonomous System Number (ASN) with an IPAM resource discovery
associate_ipam_resource_discovery	Associates an IPAM resource discovery with an Amazon VPC
associate_nat_gateway_address	Associates Elastic IP addresses (EIPs) and private IP addresses with a NAT gateway
associate_route_table	Associates a subnet in your VPC or an internet gateway with a route table
associate_subnet_cidr_block	Associates a CIDR block with your subnet
associate_transit_gateway_multicast_domain	Associates the specified subnets and transit gateway with a multicast domain
associate_transit_gateway_policy_table	Associates the specified transit gateway attachments with a policy table
associate_transit_gateway_route_table	Associates the specified attachment with the specified route table
associate_trunk_interface	Associates a branch network interface with a trunk network interface
associate_vpc_cidr_block	Associates a CIDR block with your VPC
attach_classic_link_vpc	This action is deprecated
attach_internet_gateway	Attaches an internet gateway or a virtual private gateway to a VPC
attach_network_interface	Attaches a network interface to an instance
attach_verified_access_trust_provider	Attaches the specified Amazon Web Services Verified Access Trust Provider to a VPC
attach_volume	Attaches an EBS volume to a running or stopped instance
attach_vpn_gateway	Attaches a virtual private gateway to a VPC
authorize_client_vpn_ingress	Adds an ingress authorization rule to a Client VPN endpoint
authorize_security_group_egress	Adds the specified outbound (egress) rules to a security group
authorize_security_group_ingress	Adds the specified inbound (ingress) rules to a security group
bundle_instance	Bundles an Amazon instance store-backed Windows instance
cancel_bundle_task	Cancels a bundling operation for an instance store-backed Windows instance
cancel_capacity_reservation	Cancels the specified Capacity Reservation, releasing the reserved capacity
cancel_capacity_reservation_fleets	Cancels one or more Capacity Reservation Fleets
cancel_conversion_task	Cancels an active conversion task
cancel_export_task	Cancels an active export task
cancel_image_launch_permission	Removes your Amazon Web Services account from the specified image launch permission
cancel_import_task	Cancels an in-process import virtual machine operation
cancel_reserved_instances_listing	Cancels the specified Reserved Instance listing in your account
cancel_spot_fleet_requests	Cancels the specified Spot Fleet requests
cancel_spot_instance_requests	Cancels one or more Spot Instance requests
confirm_product_instance	Determines whether a product code is associated with an instance
copy_fpga_image	Copies the specified Amazon FPGA Image (AFI) to your account
copy_image	Initiates an AMI copy operation
copy_snapshot	Copies a point-in-time snapshot of an EBS volume to your account
create_capacity_reservation	Creates a new Capacity Reservation with the specified parameters
create_capacity_reservation_by_splitting	Create a new Capacity Reservation by splitting the specified Capacity Reservation
create_capacity_reservation_fleet	Creates a Capacity Reservation Fleet
create_carrier_gateway	Creates a carrier gateway
create_client_vpn_endpoint	Creates a Client VPN endpoint
create_client_vpn_route	Adds a route to a network to a Client VPN endpoint
create_coip_cidr	Creates a range of customer-owned IP addresses
create_coip_pool	Creates a pool of customer-owned IP (CoIP) addresses
create_customer_gateway	Provides information to Amazon Web Services about a customer gateway
create_default_subnet	Creates a default subnet with a size /20 IPv4 CIDR block
create_default_vpc	Creates a default VPC with a size /16 IPv4 CIDR block
create_dhcp_options	Creates a custom set of DHCP options
create_egress_only_internet_gateway	[IPv6 only] Creates an egress-only internet gateway

<code>create_fleet</code>	Creates an EC2 Fleet that contains the configuration
<code>create_flow_logs</code>	Creates one or more flow logs to capture information
<code>create_fpga_image</code>	Creates an Amazon FPGA Image (AFI) from the
<code>create_image</code>	Creates an Amazon EBS-backed AMI from an A
<code>create_instance_connect_endpoint</code>	Creates an EC2 Instance Connect Endpoint
<code>create_instance_event_window</code>	Creates an event window in which scheduled eve
<code>create_instance_export_task</code>	Exports a running or stopped instance to an Ama
<code>create_internet_gateway</code>	Creates an internet gateway for use with a VPC
<code>create_ipam</code>	Create an IPAM
<code>create_ipam_external_resource_verification_token</code>	Create a verification token
<code>create_ipam_pool</code>	Create an IP address pool for Amazon VPC IP A
<code>create_ipam_resource_discovery</code>	Creates an IPAM resource discovery
<code>create_ipam_scope</code>	Create an IPAM scope
<code>create_key_pair</code>	Creates an ED25519 or 2048-bit RSA key pair w
<code>create_launch_template</code>	Creates a launch template
<code>create_launch_template_version</code>	Creates a new version of a launch template
<code>create_local_gateway_route</code>	Creates a static route for the specified local gatew
<code>create_local_gateway_route_table</code>	Creates a local gateway route table
<code>create_local_gateway_route_table_virtual_interface_group_association</code>	Creates a local gateway route table virtual interfa
<code>create_local_gateway_route_table_vpc_association</code>	Associates the specified VPC with the specified I
<code>create_managed_prefix_list</code>	Creates a managed prefix list
<code>create_nat_gateway</code>	Creates a NAT gateway in the specified subnet
<code>create_network_acl</code>	Creates a network ACL in a VPC
<code>create_network_acl_entry</code>	Creates an entry (a rule) in a network ACL with
<code>create_network_insights_access_scope</code>	Creates a Network Access Scope
<code>create_network_insights_path</code>	Creates a path to analyze for reachability
<code>create_network_interface</code>	Creates a network interface in the specified subn
<code>create_network_interface_permission</code>	Grants an Amazon Web Services-authorized acco
<code>create_placement_group</code>	Creates a placement group in which to launch ins
<code>create_public_ipv4_pool</code>	Creates a public IPv4 address pool
<code>create_replace_root_volume_task</code>	Replaces the EBS-backed root volume for a runn
<code>create_reserved_instances_listing</code>	Creates a listing for Amazon EC2 Standard Rese
<code>create_restore_image_task</code>	Starts a task that restores an AMI from an Amaz
<code>create_route</code>	Creates a route in a route table within a VPC
<code>create_route_table</code>	Creates a route table for the specified VPC
<code>create_security_group</code>	Creates a security group
<code>create_snapshot</code>	Creates a snapshot of an EBS volume and stores
<code>create_snapshots</code>	Creates crash-consistent snapshots of multiple E
<code>create_spot_datafeed_subscription</code>	Creates a data feed for Spot Instances, enabling y
<code>create_store_image_task</code>	Stores an AMI as a single object in an Amazon S
<code>create_subnet</code>	Creates a subnet in the specified VPC
<code>create_subnet_cidr_reservation</code>	Creates a subnet CIDR reservation
<code>create_tags</code>	Adds or overwrites only the specified tags for the
<code>create_traffic_mirror_filter</code>	Creates a Traffic Mirror filter
<code>create_traffic_mirror_filter_rule</code>	Creates a Traffic Mirror filter rule
<code>create_traffic_mirror_session</code>	Creates a Traffic Mirror session
<code>create_traffic_mirror_target</code>	Creates a target for your Traffic Mirror session
<code>create_transit_gateway</code>	Creates a transit gateway

<code>create_transit_gateway_connect</code>	Creates a Connect attachment from a specified transit gateway
<code>create_transit_gateway_connect_peer</code>	Creates a Connect peer for a specified transit gateway
<code>create_transit_gateway_multicast_domain</code>	Creates a multicast domain using the specified transit gateway
<code>create_transit_gateway_peering_attachment</code>	Requests a transit gateway peering attachment between two transit gateways
<code>create_transit_gateway_policy_table</code>	Creates a transit gateway policy table
<code>create_transit_gateway_prefix_list_reference</code>	Creates a reference (route) to a prefix list in a specified transit gateway
<code>create_transit_gateway_route</code>	Creates a static route for the specified transit gateway
<code>create_transit_gateway_route_table</code>	Creates a route table for the specified transit gateway
<code>create_transit_gateway_route_table_announcement</code>	Advertises a new transit gateway route table
<code>create_transit_gateway_vpc_attachment</code>	Attaches the specified VPC to the specified transit gateway
<code>create_verified_access_endpoint</code>	An Amazon Web Services Verified Access endpoint
<code>create_verified_access_group</code>	An Amazon Web Services Verified Access group
<code>create_verified_access_instance</code>	An Amazon Web Services Verified Access instance
<code>create_verified_access_trust_provider</code>	A trust provider is a third-party entity that creates and manages trust relationships
<code>create_volume</code>	Creates an EBS volume that can be attached to an Amazon EC2 instance
<code>create_vpc</code>	Creates a VPC with the specified CIDR blocks
<code>create_vpc_endpoint</code>	Creates a VPC endpoint
<code>create_vpc_endpoint_connection_notification</code>	Creates a connection notification for a specified VPC endpoint
<code>create_vpc_endpoint_service_configuration</code>	Creates a VPC endpoint service to which service endpoints can be attached
<code>create_vpc_peering_connection</code>	Requests a VPC peering connection between two VPCs
<code>create_vpn_connection</code>	Creates a VPN connection between an existing VPC and a customer gateway
<code>create_vpn_connection_route</code>	Creates a static route associated with a VPN connection
<code>create_vpn_gateway</code>	Creates a virtual private gateway
<code>delete_carrier_gateway</code>	Deletes a carrier gateway
<code>delete_client_vpn_endpoint</code>	Deletes the specified Client VPN endpoint
<code>delete_client_vpn_route</code>	Deletes a route from a Client VPN endpoint
<code>delete_coip_cidr</code>	Deletes a range of customer-owned IP addresses
<code>delete_coip_pool</code>	Deletes a pool of customer-owned IP (CoIP) addresses
<code>delete_customer_gateway</code>	Deletes the specified customer gateway
<code>delete_dhcp_options</code>	Deletes the specified set of DHCP options
<code>delete_egress_only_internet_gateway</code>	Deletes an egress-only internet gateway
<code>delete_fleets</code>	Deletes the specified EC2 Fleets
<code>delete_flow_logs</code>	Deletes one or more flow logs
<code>delete_fpga_image</code>	Deletes the specified Amazon FPGA Image (AFI)
<code>delete_instance_connect_endpoint</code>	Deletes the specified EC2 Instance Connect Endpoint
<code>delete_instance_event_window</code>	Deletes the specified event window
<code>delete_internet_gateway</code>	Deletes the specified internet gateway
<code>delete_ipam</code>	Delete an IPAM
<code>delete_ipam_external_resource_verification_token</code>	Delete a verification token
<code>delete_ipam_pool</code>	Delete an IPAM pool
<code>delete_ipam_resource_discovery</code>	Deletes an IPAM resource discovery
<code>delete_ipam_scope</code>	Delete the scope for an IPAM
<code>delete_key_pair</code>	Deletes the specified key pair, by removing the public key
<code>delete_launch_template</code>	Deletes a launch template
<code>delete_launch_template_versions</code>	Deletes one or more versions of a launch template
<code>delete_local_gateway_route</code>	Deletes the specified route from the specified local gateway
<code>delete_local_gateway_route_table</code>	Deletes a local gateway route table
<code>delete_local_gateway_route_table_virtual_interface_group_association</code>	Deletes a local gateway route table virtual interface group association

<code>delete_local_gateway_route_table_vpc_association</code>	Deletes the specified association between a VPC
<code>delete_managed_prefix_list</code>	Deletes the specified managed prefix list
<code>delete_nat_gateway</code>	Deletes the specified NAT gateway
<code>delete_network_acl</code>	Deletes the specified network ACL
<code>delete_network_acl_entry</code>	Deletes the specified ingress or egress entry (rule)
<code>delete_network_insights_access_scope</code>	Deletes the specified Network Access Scope
<code>delete_network_insights_access_scope_analysis</code>	Deletes the specified Network Access Scope ana
<code>delete_network_insights_analysis</code>	Deletes the specified network insights analysis
<code>delete_network_insights_path</code>	Deletes the specified path
<code>delete_network_interface</code>	Deletes the specified network interface
<code>delete_network_interface_permission</code>	Deletes a permission for a network interface
<code>delete_placement_group</code>	Deletes the specified placement group
<code>delete_public_ipv4_pool</code>	Delete a public IPv4 pool
<code>delete_queued_reserved_instances</code>	Deletes the queued purchases for the specified R
<code>delete_route</code>	Deletes the specified route from the specified rou
<code>delete_route_table</code>	Deletes the specified route table
<code>delete_security_group</code>	Deletes a security group
<code>delete_snapshot</code>	Deletes the specified snapshot
<code>delete_spot_datafeed_subscription</code>	Deletes the data feed for Spot Instances
<code>delete_subnet</code>	Deletes the specified subnet
<code>delete_subnet_cidr_reservation</code>	Deletes a subnet CIDR reservation
<code>delete_tags</code>	Deletes the specified set of tags from the specifie
<code>delete_traffic_mirror_filter</code>	Deletes the specified Traffic Mirror filter
<code>delete_traffic_mirror_filter_rule</code>	Deletes the specified Traffic Mirror rule
<code>delete_traffic_mirror_session</code>	Deletes the specified Traffic Mirror session
<code>delete_traffic_mirror_target</code>	Deletes the specified Traffic Mirror target
<code>delete_transit_gateway</code>	Deletes the specified transit gateway
<code>delete_transit_gateway_connect</code>	Deletes the specified Connect attachment
<code>delete_transit_gateway_connect_peer</code>	Deletes the specified Connect peer
<code>delete_transit_gateway_multicast_domain</code>	Deletes the specified transit gateway multicast do
<code>delete_transit_gateway_peering_attachment</code>	Deletes a transit gateway peering attachment
<code>delete_transit_gateway_policy_table</code>	Deletes the specified transit gateway policy table
<code>delete_transit_gateway_prefix_list_reference</code>	Deletes a reference (route) to a prefix list in a spe
<code>delete_transit_gateway_route</code>	Deletes the specified route from the specified tran
<code>delete_transit_gateway_route_table</code>	Deletes the specified transit gateway route table
<code>delete_transit_gateway_route_table_announcement</code>	Advertises to the transit gateway that a transit ga
<code>delete_transit_gateway_vpc_attachment</code>	Deletes the specified VPC attachment
<code>delete_verified_access_endpoint</code>	Delete an Amazon Web Services Verified Access
<code>delete_verified_access_group</code>	Delete an Amazon Web Services Verified Access
<code>delete_verified_access_instance</code>	Delete an Amazon Web Services Verified Access
<code>delete_verified_access_trust_provider</code>	Delete an Amazon Web Services Verified Access
<code>delete_volume</code>	Deletes the specified EBS volume
<code>delete_vpc</code>	Deletes the specified VPC
<code>delete_vpc_endpoint_connection_notifications</code>	Deletes the specified VPC endpoint connection n
<code>delete_vpc_endpoints</code>	Deletes the specified VPC endpoints
<code>delete_vpc_endpoint_service_configurations</code>	Deletes the specified VPC endpoint service confi
<code>delete_vpc_peering_connection</code>	Deletes a VPC peering connection
<code>delete_vpn_connection</code>	Deletes the specified VPN connection

<code>delete_vpn_connection_route</code>	Deletes the specified static route associated with
<code>delete_vpn_gateway</code>	Deletes the specified virtual private gateway
<code>deprovision_byoip_cidr</code>	Releases the specified address range that you pro
<code>deprovision_ipam_byoasn</code>	Deprovisions your Autonomous System Number
<code>deprovision_ipam_pool_cidr</code>	Deprovision a CIDR provisioned from an IPAM
<code>deprovision_public_ipv4_pool_cidr</code>	Deprovision a CIDR from a public IPv4 pool
<code>deregister_image</code>	Deregisters the specified AMI
<code>deregister_instance_event_notification_attributes</code>	Deregisters tag keys to prevent tags that have the
<code>deregister_transit_gateway_multicast_group_members</code>	Deregisters the specified members (network inter
<code>deregister_transit_gateway_multicast_group_sources</code>	Deregisters the specified sources (network interfa
<code>describe_account_attributes</code>	Describes attributes of your Amazon Web Servic
<code>describe_addresses</code>	Describes the specified Elastic IP addresses or al
<code>describe_addresses_attribute</code>	Describes the attributes of the specified Elastic IP
<code>describe_address_transfers</code>	Describes an Elastic IP address transfer
<code>describe_aggregate_id_format</code>	Describes the longer ID format settings for all re

Describes the specified placement groups or all of the placement groups in your account
 Describes available Amazon Web Services services in your account
 Describes the ID format settings for the root user in your account
 Describes the specified IPv4 address pools
 Describes the Regions that are enabled for your account
 Describes a root volume replacement task
 Describes one or more of the Reserved Instances in your account
 Describes your account's Reserved Instance listings
 Describes the modifications made to your Reserved Instances
 Describes Reserved Instance offerings that are available in your account
 Describes your route tables
 Finds available schedules that meet the specified criteria
 Describes the specified Scheduled Instances or all of the Scheduled Instances in your account
 Describes the VPCs on the other side of a VPC peering connection
 Describes one or more of your security group rules
 Describes the specified security groups or all of the security groups in your account
 Describes the specified attribute of the specified snapshots
 Describes the specified EBS snapshots available in your account
 Describes the storage tier status of one or more Amazon EBS volumes
 Describes the data feed for Spot Instances
 Describes the running instances for the specified Spot Fleet request
 Describes the events for the specified Spot Fleet request
 Describes your Spot Fleet requests
 Describes the specified Spot Instance requests
 Describes the Spot price history
 Describes the stale security group rules for security groups in your account
 Describes the progress of the AMI store tasks
 Describes your subnets
 Describes the specified tags for your EC2 resources
 Describe traffic mirror filters that determine the traffic to be mirrored
 Describes one or more Traffic Mirror filters
 Describes one or more Traffic Mirror sessions
 Information about one or more Traffic Mirror targets
 Describes one or more attachments between resources
 Describes one or more Connect peers
 Describes one or more Connect attachments
 Describes one or more transit gateway multicast domains
 Describes your transit gateway peering attachments
 Describes one or more transit gateway route policies
 Describes one or more transit gateway route table announcements
 Describes one or more transit gateway route tables
 Describes one or more transit gateways
 Describes one or more VPC attachments
 Describes one or more network interface trunk associations
 Describes the specified Amazon Web Services Verified Access endpoints
 Describes the specified Verified Access groups
 Describes the specified Amazon Web Services Verified Access instance logging configurations
 Describes the specified Amazon Web Services Verified Access instances

describe_verified_access_trust_providers	Describes the specified Amazon Web Services Verified Access trust providers
describe_volume_attribute	Describes the specified attribute of the specified volume
describe_volumes	Describes the specified EBS volumes or all of your account's EBS volumes
describe_volumes_modifications	Describes the most recent volume modification records
describe_volume_status	Describes the status of the specified volumes
describe_vpc_attribute	Describes the specified attribute of the specified VPC
describe_vpc_classic_link	This action is deprecated
describe_vpc_classic_link_dns_support	This action is deprecated
describe_vpc_endpoint_connection_notifications	Describes the connection notifications for VPC endpoints
describe_vpc_endpoint_connections	Describes the VPC endpoint connections to your VPC
describe_vpc_endpoints	Describes your VPC endpoints
describe_vpc_endpoint_service_configurations	Describes the VPC endpoint service configurations
describe_vpc_endpoint_service_permissions	Describes the principals (service consumers) that are authorized to use the VPC endpoint service
describe_vpc_endpoint_services	Describes available services to which you can create VPC endpoints
describe_vpc_peering_connections	Describes your VPC peering connections
describe_vpcs	Describes your VPCs
describe_vpn_connections	Describes one or more of your VPN connections
describe_vpn_gateways	Describes one or more of your virtual private gateways
detach_classic_link_vpc	This action is deprecated
detach_internet_gateway	Detaches an internet gateway from a VPC, disabling it
detach_network_interface	Detaches a network interface from an instance
detach_verified_access_trust_provider	Detaches the specified Amazon Web Services Verified Access trust provider
detach_volume	Detaches an EBS volume from an instance
detach_vpn_gateway	Detaches a virtual private gateway from a VPC
disable_address_transfer	Disables Elastic IP address transfer
disable_aws_network_performance_metric_subscription	Disables Infrastructure Performance metric subscription
disable_ebs_encryption_by_default	Disables EBS encryption by default for your account
disable_fast_launch	Discontinue Windows fast launch for a Windows instance
disable_fast_snapshot_restores	Disables fast snapshot restores for the specified snapshot
disable_image	Sets the AMI state to disabled and removes all launch permissions
disable_image_block_public_access	Disables block public access for AMIs at the account level
disable_image_deprecation	Cancels the deprecation of the specified AMI
disable_image_deregistration_protection	Disables deregistration protection for an AMI
disable_ipam_organization_admin_account	Disable the IPAM account
disable_serial_console_access	Disables access to the EC2 serial console of all instances
disable_snapshot_block_public_access	Disables the block public access for snapshots set at the account level
disable_transit_gateway_route_table_propagation	Disables the specified resource attachment from the transit gateway route table
disable_vgw_route_propagation	Disables a virtual private gateway (VGW) from propagating routes
disable_vpc_classic_link	This action is deprecated
disable_vpc_classic_link_dns_support	This action is deprecated
disassociate_address	Disassociates an Elastic IP address from the instance
disassociate_client_vpn_target_network	Disassociates a target network from the specified client VPN connection
disassociate_enclave_certificate_iam_role	Disassociates an IAM role from an Certificate Management enrollment profile
disassociate_iam_instance_profile	Disassociates an IAM instance profile from a running instance
disassociate_instance_event_window	Disassociates one or more targets from an event window
disassociate_ipam_byoasn	Remove the association between your Autonomous System (AS) and Amazon IPAM
disassociate_ipam_resource_discovery	Disassociates a resource discovery from an Amazon IPAM resource
disassociate_nat_gateway_address	Disassociates secondary Elastic IP addresses (EIPs) from a NAT gateway

disassociate_route_table	Disassociates a subnet or gateway from a route table
disassociate_subnet_cidr_block	Disassociates a CIDR block from a subnet
disassociate_transit_gateway_multicast_domain	Disassociates the specified subnets from the transit gateway
disassociate_transit_gateway_policy_table	Removes the association between an attachment and a policy table
disassociate_transit_gateway_route_table	Disassociates a resource attachment from a transit gateway
disassociate_trunk_interface	Removes an association between a branch network and a trunk interface
disassociate_vpc_cidr_block	Disassociates a CIDR block from a VPC
enable_address_transfer	Enables Elastic IP address transfer
enable_aws_network_performance_metric_subscription	Enables Infrastructure Performance subscriptions
enable_ebs_encryption_by_default	Enables EBS encryption by default for your account
enable_fast_launch	When you enable Windows fast launch for a Windows instance, you can enable fast launch for a Windows instance
enable_fast_snapshot_restores	Enables fast snapshot restores for the specified snapshot
enable_image	Re-enables a disabled AMI
enable_image_block_public_access	Enables block public access for AMIs at the account level
enable_image_deprecation	Enables deprecation of the specified AMI at the account level
enable_image_deregistration_protection	Enables deregistration protection for an AMI
enable_ipam_organization_admin_account	Enable an Organizations member account as the administrator
enable_reachability_analyzer_organization_sharing	Establishes a trust relationship between Reachability Analyzer and the specified organization
enable_serial_console_access	Enables access to the EC2 serial console of all instances in the specified VPC
enable_snapshot_block_public_access	Enables or modifies the block public access for snapshots
enable_transit_gateway_route_table_propagation	Enables the specified attachment to propagate routes
enable_vgw_route_propagation	Enables a virtual private gateway (VGW) to propagate routes
enable_volume_io	Enables I/O operations for a volume that had I/O throttling
enable_vpc_classic_link	This action is deprecated
enable_vpc_classic_link_dns_support	This action is deprecated
export_client_vpn_client_certificate_revocation_list	Downloads the client certificate revocation list for the specified Client VPN endpoint
export_client_vpn_client_configuration	Downloads the contents of the Client VPN endpoint
export_image	Exports an Amazon Machine Image (AMI) to a new region
export_transit_gateway_routes	Exports routes from the specified transit gateway
get_associated_enclave_certificate_iam_roles	Returns the IAM roles that are associated with the specified enclave certificate
get_associated_ipv6_pool_cidrs	Gets information about the IPv6 CIDR block associated with the specified VPC
get_aws_network_performance_data	Gets network performance data
get_capacity_reservation_usage	Gets usage information about a Capacity Reservation
get_coip_pool_usage	Describes the allocations from the specified customer IP pool
get_console_output	Gets the console output for the specified instance
get_console_screenshot	Retrieve a JPG-format screenshot of a running instance
get_default_credit_specification	Describes the default credit option for CPU usage
get_ebs_default_kms_key_id	Describes the default KMS key for EBS encryption
get_ebs_encryption_by_default	Describes whether EBS encryption by default is enabled
get_flow_logs_integration_template	Generates a CloudFormation template that streamlines flow log creation
get_groups_for_capacity_reservation	Lists the resource groups to which a Capacity Reservation is associated
get_host_reservation_purchase_preview	Preview a reservation purchase with configuration
get_image_block_public_access_state	Gets the current state of block public access for AMIs
get_instance_metadata_defaults	Gets the default instance metadata service (IMDS) settings
get_instance_tpm_ek_public_key	Gets the public endorsement key associated with the specified instance
get_instance_types_from_instance_requirements	Returns a list of instance types with the specified requirements
get_instance_uefi_data	A binary representation of the UEFI variable store
get_ipam_address_history	Retrieve historical information about a CIDR with IPAM

<code>get_ipam_discovered_accounts</code>	Gets IPAM discovered accounts
<code>get_ipam_discovered_public_addresses</code>	Gets the public IP addresses that have been discovered
<code>get_ipam_discovered_resource_cidrs</code>	Returns the resource CIDRs that are monitored and managed by IPAM
<code>get_ipam_pool_allocations</code>	Get a list of all the CIDR allocations in an IPAM pool
<code>get_ipam_pool_cidrs</code>	Get the CIDRs provisioned to an IPAM pool
<code>get_ipam_resource_cidrs</code>	Returns resource CIDRs managed by IPAM in a Region
<code>get_launch_template_data</code>	Retrieves the configuration data of the specified launch template
<code>get_managed_prefix_list_associations</code>	Gets information about the resources that are associated with a prefix list
<code>get_managed_prefix_list_entries</code>	Gets information about the entries for a specified prefix list
<code>get_network_insights_access_scope_analysis_findings</code>	Gets the findings for the specified Network Access Scope
<code>get_network_insights_access_scope_content</code>	Gets the content for the specified Network Access Scope
<code>get_password_data</code>	Retrieves the encrypted administrator password for the specified account
<code>get_reserved_instances_exchange_quote</code>	Returns a quote and exchange information for exchanging reserved instances
<code>get_security_groups_for_vpc</code>	Gets security groups that can be associated by the specified VPC
<code>get_serial_console_access_status</code>	Retrieves the access status of your account to the specified instance
<code>get_snapshot_block_public_access_state</code>	Gets the current state of block public access for the specified snapshot
<code>get_spot_placement_scores</code>	Calculates the Spot placement score for a Region
<code>get_subnet_cidr_reservations</code>	Gets information about the subnet CIDR reservations
<code>get_transit_gateway_attachment_propagations</code>	Lists the route tables to which the specified resource is attached
<code>get_transit_gateway_multicast_domain_associations</code>	Gets information about the associations for the transit gateway
<code>get_transit_gateway_policy_table_associations</code>	Gets a list of the transit gateway policy table associations
<code>get_transit_gateway_policy_table_entries</code>	Returns a list of transit gateway policy table entries
<code>get_transit_gateway_prefix_list_references</code>	Gets information about the prefix list references
<code>get_transit_gateway_route_table_associations</code>	Gets information about the associations for the specified transit gateway
<code>get_transit_gateway_route_table_propagations</code>	Gets information about the route table propagation
<code>get_verified_access_endpoint_policy</code>	Get the Verified Access policy associated with the specified endpoint
<code>get_verified_access_group_policy</code>	Shows the contents of the Verified Access policy
<code>get_vpn_connection_device_sample_configuration</code>	Download an Amazon Web Services-provided sample configuration
<code>get_vpn_connection_device_types</code>	Obtain a list of customer gateway devices for which you can create a connection
<code>get_vpn_tunnel_replacement_status</code>	Get details of available tunnel endpoint maintenance
<code>import_client_vpn_client_certificate_revocation_list</code>	Uploads a client certificate revocation list to the specified Client VPN endpoint
<code>import_image</code>	To import your virtual machines (VMs) with a custom image
<code>import_instance</code>	We recommend that you use the ImportImage API
<code>import_key_pair</code>	Imports the public key from an RSA or ED25519 key pair
<code>import_snapshot</code>	Imports a disk into an EBS snapshot
<code>import_volume</code>	Creates an import volume task using metadata from a snapshot
<code>list_images_in_recycle_bin</code>	Lists one or more AMIs that are currently in the recycle bin
<code>list_snapshots_in_recycle_bin</code>	Lists one or more snapshots that are currently in the recycle bin
<code>lock_snapshot</code>	Locks an Amazon EBS snapshot in either government or standard use
<code>modify_address_attribute</code>	Modifies an attribute of the specified Elastic IP address
<code>modify_availability_zone_group</code>	Changes the opt-in status of the specified zone group
<code>modify_capacity_reservation</code>	Modifies a Capacity Reservation's capacity, instance type, or platform
<code>modify_capacity_reservation_fleet</code>	Modifies a Capacity Reservation Fleet
<code>modify_client_vpn_endpoint</code>	Modifies the specified Client VPN endpoint
<code>modify_default_credit_specification</code>	Modifies the default credit option for CPU usage
<code>modify_ebs_default_kms_key_id</code>	Changes the default KMS key for EBS encryption
<code>modify_fleet</code>	Modifies the specified EC2 Fleet
<code>modify_fpga_image_attribute</code>	Modifies the specified attribute of the specified Amazon FPGA Image

<code>modify_hosts</code>	Modify the auto-placement setting of a Dedicated Host
<code>modify_identity_id_format</code>	Modifies the ID format of a resource for a specified resource
<code>modify_id_format</code>	Modifies the ID format for the specified resource
<code>modify_image_attribute</code>	Modifies the specified attribute of the specified Amazon Machine Image
<code>modify_instance_attribute</code>	Modifies the specified attribute of the specified instance
<code>modify_instance_capacity_reservation_attributes</code>	Modifies the Capacity Reservation settings for a specified instance
<code>modify_instance_credit_specification</code>	Modifies the credit option for CPU usage on a running instance
<code>modify_instance_event_start_time</code>	Modifies the start time for a scheduled Amazon EC2 Instance Maintenance
<code>modify_instance_event_window</code>	Modifies the specified event window
<code>modify_instance_maintenance_options</code>	Modifies the recovery behavior of your instance
<code>modify_instance_metadata_defaults</code>	Modifies the default instance metadata service (IMDS) settings
<code>modify_instance_metadata_options</code>	Modify the instance metadata parameters on a running instance
<code>modify_instance_placement</code>	Modifies the placement attributes for a specified instance
<code>modify_ipam</code>	Modify the configurations of an IPAM
<code>modify_ipam_pool</code>	Modify the configurations of an IPAM pool
<code>modify_ipam_resource_cidr</code>	Modify a resource CIDR
<code>modify_ipam_resource_discovery</code>	Modifies a resource discovery
<code>modify_ipam_scope</code>	Modify an IPAM scope
<code>modify_launch_template</code>	Modifies a launch template
<code>modify_local_gateway_route</code>	Modifies the specified local gateway route
<code>modify_managed_prefix_list</code>	Modifies the specified managed prefix list
<code>modify_network_interface_attribute</code>	Modifies the specified network interface attribute
<code>modify_private_dns_name_options</code>	Modifies the options for instance hostnames for t2 instances
<code>modify_reserved_instances</code>	Modifies the configuration of your Reserved Instance
<code>modify_security_group_rules</code>	Modifies the rules of a security group
<code>modify_snapshot_attribute</code>	Adds or removes permission settings for the specified Amazon EBS snapshot
<code>modify_snapshot_tier</code>	Archives an Amazon EBS snapshot
<code>modify_spot_fleet_request</code>	Modifies the specified Spot Fleet request
<code>modify_subnet_attribute</code>	Modifies a subnet attribute
<code>modify_traffic_mirror_filter_network_services</code>	Allows or restricts mirroring network services
<code>modify_traffic_mirror_filter_rule</code>	Modifies the specified Traffic Mirror rule
<code>modify_traffic_mirror_session</code>	Modifies a Traffic Mirror session
<code>modify_transit_gateway</code>	Modifies the specified transit gateway
<code>modify_transit_gateway_prefix_list_reference</code>	Modifies a reference (route) to a prefix list in a specified transit gateway
<code>modify_transit_gateway_vpc_attachment</code>	Modifies the specified VPC attachment
<code>modify_verified_access_endpoint</code>	Modifies the configuration of the specified Amazon Verified Access endpoint
<code>modify_verified_access_endpoint_policy</code>	Modifies the specified Amazon Web Services Verified Access endpoint policy
<code>modify_verified_access_group</code>	Modifies the specified Amazon Web Services Verified Access group
<code>modify_verified_access_group_policy</code>	Modifies the specified Amazon Web Services Verified Access group policy
<code>modify_verified_access_instance</code>	Modifies the configuration of the specified Amazon Verified Access instance
<code>modify_verified_access_instance_logging_configuration</code>	Modifies the logging configuration for the specified Amazon Verified Access instance
<code>modify_verified_access_trust_provider</code>	Modifies the configuration of the specified Amazon Verified Access trust provider
<code>modify_volume</code>	You can modify several parameters of an existing Amazon EBS volume
<code>modify_volume_attribute</code>	Modifies a volume attribute
<code>modify_vpc_attribute</code>	Modifies the specified attribute of the specified VPC
<code>modify_vpc_endpoint</code>	Modifies attributes of a specified VPC endpoint
<code>modify_vpc_endpoint_connection_notification</code>	Modifies a connection notification for VPC endpoint
<code>modify_vpc_endpoint_service_configuration</code>	Modifies the attributes of your VPC endpoint service

<code>modify_vpc_endpoint_service_payer_responsibility</code>	Modifies the payer responsibility for your VPC endpoint
<code>modify_vpc_endpoint_service_permissions</code>	Modifies the permissions for your VPC endpoint
<code>modify_vpc_peering_connection_options</code>	Modifies the VPC peering connection options on
<code>modify_vpc_tenancy</code>	Modifies the instance tenancy attribute of the spe
<code>modify_vpn_connection</code>	Modifies the customer gateway or the target gate
<code>modify_vpn_connection_options</code>	Modifies the connection options for your Site-to-
<code>modify_vpn_tunnel_certificate</code>	Modifies the VPN tunnel endpoint certificate
<code>modify_vpn_tunnel_options</code>	Modifies the options for a VPN tunnel in an Am
<code>monitor_instances</code>	Enables detailed monitoring for a running instan
<code>move_address_to_vpc</code>	This action is deprecated
<code>move_byoip_cidr_to_ipam</code>	Move a BYOIPv4 CIDR to IPAM from a public
<code>move_capacity_reservation_instances</code>	Move available capacity from a source Capacity
<code>provision_byoip_cidr</code>	Provisions an IPv4 or IPv6 address range for use
<code>provision_ipam_byoasn</code>	Provisions your Autonomous System Number (A
<code>provision_ipam_pool_cidr</code>	Provision a CIDR to an IPAM pool
<code>provision_public_ipv4_pool_cidr</code>	Provision a CIDR to a public IPv4 pool
<code>purchase_capacity_block</code>	Purchase the Capacity Block for use with your ac
<code>purchase_host_reservation</code>	Purchase a reservation with configurations that m
<code>purchase_reserved_instances_offering</code>	Purchases a Reserved Instance for use with your
<code>purchase_scheduled_instances</code>	You can no longer purchase Scheduled Instances
<code>reboot_instances</code>	Requests a reboot of the specified instances
<code>register_image</code>	Registers an AMI
<code>register_instance_event_notification_attributes</code>	Registers a set of tag keys to include in schedule
<code>register_transit_gateway_multicast_group_members</code>	Registers members (network interfaces) with the
<code>register_transit_gateway_multicast_group_sources</code>	Registers sources (network interfaces) with the s
<code>reject_transit_gateway_multicast_domain_associations</code>	Rejects a request to associate cross-account subn
<code>reject_transit_gateway_peering_attachment</code>	Rejects a transit gateway peering attachment req
<code>reject_transit_gateway_vpc_attachment</code>	Rejects a request to attach a VPC to a transit gate
<code>reject_vpc_endpoint_connections</code>	Rejects VPC endpoint connection requests to you
<code>reject_vpc_peering_connection</code>	Rejects a VPC peering connection request
<code>release_address</code>	Releases the specified Elastic IP address
<code>release_hosts</code>	When you no longer want to use an On-Demand
<code>release_ipam_pool_allocation</code>	Release an allocation within an IPAM pool
<code>replace_iam_instance_profile_association</code>	Replaces an IAM instance profile for the specifie
<code>replace_network_acl_association</code>	Changes which network ACL a subnet is associa
<code>replace_network_acl_entry</code>	Replaces an entry (rule) in a network ACL
<code>replace_route</code>	Replaces an existing route within a route table in
<code>replace_route_table_association</code>	Changes the route table associated with a given s
<code>replace_transit_gateway_route</code>	Replaces the specified route in the specified trans
<code>replace_vpn_tunnel</code>	Trigger replacement of specified VPN tunnel
<code>report_instance_status</code>	Submits feedback about the status of an instance
<code>request_spot_fleet</code>	Creates a Spot Fleet request
<code>request_spot_instances</code>	Creates a Spot Instance request
<code>reset_address_attribute</code>	Resets the attribute of the specified IP address
<code>reset_ebs_default_kms_key_id</code>	Resets the default KMS key for EBS encryption
<code>reset_fpga_image_attribute</code>	Resets the specified attribute of the specified Am
<code>reset_image_attribute</code>	Resets an attribute of an AMI to its default value
<code>reset_instance_attribute</code>	Resets an attribute of an instance to its default va

reset_network_interface_attribute	Resets a network interface attribute
reset_snapshot_attribute	Resets permission settings for the specified snapshot
restore_address_to_classic	This action is deprecated
restore_image_from_recycle_bin	Restores an AMI from the Recycle Bin
restore_managed_prefix_list_version	Restores the entries from a previous version of a managed prefix list
restore_snapshot_from_recycle_bin	Restores a snapshot from the Recycle Bin
restore_snapshot_tier	Restores an archived Amazon EBS snapshot for a new tier
revoke_client_vpn_ingress	Removes an ingress authorization rule from a Client VPN endpoint
revoke_security_group_egress	Removes the specified outbound (egress) rules from a security group
revoke_security_group_ingress	Removes the specified inbound (ingress) rules from a security group
run_instances	Launches the specified number of instances using the specified parameters
run_scheduled_instances	Launches the specified Scheduled Instances
search_local_gateway_routes	Searches for routes in the specified local gateway
search_transit_gateway_multicast_groups	Searches one or more transit gateway multicast groups
search_transit_gateway_routes	Searches for routes in the specified transit gateway
send_diagnostic_interrupt	Sends a diagnostic interrupt to the specified Amazon EC2 instance
start_instances	Starts an Amazon EBS-backed instance that you have previously stopped
start_network_insights_access_scope_analysis	Starts analyzing the specified Network Access Scope
start_network_insights_analysis	Starts analyzing the specified path
start_vpc_endpoint_service_private_dns_verification	Initiates the verification process to prove that the specified VPC endpoint is private
stop_instances	Stops an Amazon EBS-backed instance
terminate_client_vpn_connections	Terminates active Client VPN endpoint connections
terminate_instances	Shuts down the specified instances
unassign_ipv6_addresses	Unassigns one or more IPv6 addresses from an Amazon EC2 instance
unassign_private_ip_addresses	Unassigns one or more secondary private IP addresses from an Amazon EC2 instance
unassign_private_nat_gateway_address	Unassigns secondary private IPv4 addresses from a NAT gateway
unlock_snapshot	Unlocks a snapshot that is locked in governance
unmonitor_instances	Disables detailed monitoring for a running instance
update_security_group_rule_descriptions_egress	Updates the description of an egress (outbound) rule in a security group
update_security_group_rule_descriptions_ingress	Updates the description of an ingress (inbound) rule in a security group
withdraw_byoip_cidr	Stops advertising an address range that is provisioned by you

Examples

```
## Not run:
svc <- ec2()
# This example allocates an Elastic IP address.
svc$allocate_address()

## End(Not run)
```

Description

This is the *Amazon EC2 Instance Connect API Reference*. It provides descriptions, syntax, and usage examples for each of the actions for Amazon EC2 Instance Connect. Amazon EC2 Instance Connect enables system administrators to publish one-time use SSH public keys to EC2, providing users a simple and secure way to connect to their instances.

To view the Amazon EC2 Instance Connect content in the *Amazon EC2 User Guide*, see [Connect to your Linux instance using EC2 Instance Connect](#).

For Amazon EC2 APIs, see the [Amazon EC2 API Reference](#).

Usage

```
ec2instanceconnect(
    config = list(),
    credentials = list(),
    endpoint = NULL,
    region = NULL
)
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **credentials:**
 - **creds:**
 - * **access_key_id:** AWS access key ID
 - * **secret_access_key:** AWS secret access key
 - * **session_token:** AWS temporary session token
 - **profile:** The name of a profile to use. If not given, then the default profile is used.
 - **anonymous:** Set anonymous credentials.
- **endpoint:** The complete URL to use for the constructed client.
- **region:** The AWS Region used in instantiating the client.
- **close_connection:** Immediately close all HTTP connections.
- **timeout:** The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style:** Set this to `true` to force the request to use path-style addressing, i.e. `http://s3.amazonaws.com/BUCKET/KEY`.
- **sts_regional_endpoint:** Set sts regional endpoint resolver to regional or legacy <https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html>

`credentials` Optional credentials shorthand for the `config` parameter

- **creds:**
 - **access_key_id:** AWS access key ID
 - **secret_access_key:** AWS secret access key
 - **session_token:** AWS temporary session token

- **profile:** The name of a profile to use. If not given, then the default profile is used.
 - **anonymous:** Set anonymous credentials.
- endpoint Optional shorthand for complete URL to use for the constructed client.
- region Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ec2instanceconnect(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

send_serial_console_ssh_public_key	Pushes an SSH public key to the specified EC2 instance
send_ssh_public_key	Pushes an SSH public key to the specified EC2 instance for use by the specified user

Examples

```
## Not run:
svc <- ec2instanceconnect()
# The following example pushes a sample SSH public key to the EC2 instance
# i-abcd1234 in AZ us-west-2b for use by the instance OS user ec2-user.
svc$send_ssh_public_key(
  AvailabilityZone = "us-west-2a",
  InstanceId = "i-abcd1234",
  InstanceOSUser = "ec2-user",
  SSHPublicKey = "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQ3F1Hqj2eqCdrGHuA6d..."
)

## End(Not run)
```

 ecr

Amazon EC2 Container Registry

Description

Amazon Elastic Container Registry

Amazon Elastic Container Registry (Amazon ECR) is a managed container image registry service. Customers can use the familiar Docker CLI, or their preferred client, to push, pull, and manage images. Amazon ECR provides a secure, scalable, and reliable registry for your Docker or Open Container Initiative (OCI) images. Amazon ECR supports private repositories with resource-based permissions using IAM so that specific users or Amazon EC2 instances can access repositories and images.

Amazon ECR has service endpoints in each supported Region. For more information, see [Amazon ECR endpoints](#) in the *Amazon Web Services General Reference*.

Usage

```
ecr(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **credentials:**

- **creds:**

- * **access_key_id:** AWS access key ID
- * **secret_access_key:** AWS secret access key

	<ul style="list-style-type: none"> * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ecr(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
```

```

        close_connection = "logical",
        timeout = "numeric",
        s3_force_path_style = "logical",
        sts_regional_endpoint = "string"
    ),
    credentials = list(
        creds = list(
            access_key_id = "string",
            secret_access_key = "string",
            session_token = "string"
        ),
        profile = "string",
        anonymous = "logical"
    ),
    endpoint = "string",
    region = "string"
)

```

Operations

batch_check_layer_availability	Checks the availability of one or more image layers in a repository
batch_delete_image	Deletes a list of specified images within a repository
batch_get_image	Gets detailed information for an image
batch_get_repository_scanning_configuration	Gets the scanning configuration for one or more repositories
complete_layer_upload	Notifies Amazon ECR that the image layer upload has completed for a specified image
create_pull_through_cache_rule	Creates a pull through cache rule
create_repository	Creates a repository
create_repository_creation_template	Creates a repository creation template
delete_lifecycle_policy	Deletes the lifecycle policy associated with the specified repository
delete_pull_through_cache_rule	Deletes a pull through cache rule
delete_registry_policy	Deletes the registry permissions policy
delete_repository	Deletes a repository
delete_repository_creation_template	Deletes a repository creation template
delete_repository_policy	Deletes the repository policy associated with the specified repository
describe_image_replication_status	Returns the replication status for a specified image
describe_images	Returns metadata about the images in a repository
describe_image_scan_findings	Returns the scan findings for the specified image
describe_pull_through_cache_rules	Returns the pull through cache rules for a registry
describe_registry	Describes the settings for a registry
describe_repositories	Describes image repositories in a registry
describe_repository_creation_templates	Returns details about the repository creation templates in a registry
get_account_setting	Retrieves the basic scan type version name
get_authorization_token	Retrieves an authorization token
get_download_url_for_layer	Retrieves the pre-signed Amazon S3 download URL corresponding to an image layer
get_lifecycle_policy	Retrieves the lifecycle policy for the specified repository
get_lifecycle_policy_preview	Retrieves the results of the lifecycle policy preview request for the specified repository
get_registry_policy	Retrieves the permissions policy for a registry
get_registry_scanning_configuration	Retrieves the scanning configuration for a registry

get_repository_policy	Retrieves the repository policy for the specified repository
initiate_layer_upload	Notifies Amazon ECR that you intend to upload an image layer
list_images	Lists all the image IDs for the specified repository
list_tags_for_resource	List the tags for an Amazon ECR resource
put_account_setting	Allows you to change the basic scan type version by setting the name parameter
put_image	Creates or updates the image manifest and tags associated with an image
put_image_scanning_configuration	The PutImageScanningConfiguration API is being deprecated, in favor of put_image_scanning_configuration
put_image_tag_mutability	Updates the image tag mutability settings for the specified repository
put_lifecycle_policy	Creates or updates the lifecycle policy for the specified repository
put_registry_policy	Creates or updates the permissions policy for your registry
put_registry_scanning_configuration	Creates or updates the scanning configuration for your private registry
put_replication_configuration	Creates or updates the replication configuration for a registry
set_repository_policy	Applies a repository policy to the specified repository to control access permissions
start_image_scan	Starts an image vulnerability scan
start_lifecycle_policy_preview	Starts a preview of a lifecycle policy for the specified repository
tag_resource	Adds specified tags to a resource with the specified ARN
untag_resource	Deletes specified tags from a resource
update_pull_through_cache_rule	Updates an existing pull through cache rule
update_repository_creation_template	Updates an existing repository creation template
upload_layer_part	Uploads an image layer part to Amazon ECR
validate_pull_through_cache_rule	Validates an existing pull through cache rule for an upstream registry that requires authentication

Examples

```
## Not run:
svc <- ecr()
# This example deletes images with the tags precise and trusty in a
# repository called ubuntu in the default registry for an account.
svc$batch_delete_image(
  imageIds = list(
    list(
      imageTag = "precise"
    )
  ),
  repositoryName = "ubuntu"
)

## End(Not run)
```

Description

Amazon Elastic Container Registry Public (Amazon ECR Public) is a managed container image registry service. Amazon ECR provides both public and private registries to host your container images. You can use the Docker CLI or your preferred client to push, pull, and manage images. Amazon ECR provides a secure, scalable, and reliable registry for your Docker or Open Container Initiative (OCI) images. Amazon ECR supports public repositories with this API. For information about the Amazon ECR API for private repositories, see [Amazon Elastic Container Registry API Reference](#).

Usage

```
ecrpublic(
    config = list(),
    credentials = list(),
    endpoint = NULL,
    region = NULL
)
```

Arguments

- | | |
|-------------|--|
| config | <p>Optional configuration of credentials, endpoint, and/or region.</p> <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html |
| credentials | <p>Optional credentials shorthand for the config parameter</p> <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token |

- **profile:** The name of a profile to use. If not given, then the default profile is used.
 - **anonymous:** Set anonymous credentials.
- endpoint Optional shorthand for complete URL to use for the constructed client.
- region Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ecrpublic(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

<code>batch_check_layer_availability</code>	Checks the availability of one or more image layers that are within a repository in a public registry
<code>batch_delete_image</code>	Deletes a list of specified images that are within a repository in a public registry
<code>complete_layer_upload</code>	Notifies Amazon ECR that the image layer upload is complete for a specified public registry
<code>create_repository</code>	Creates a repository in a public registry
<code>delete_repository</code>	Deletes a repository in a public registry
<code>delete_repository_policy</code>	Deletes the repository policy that's associated with the specified repository
<code>describe_images</code>	Returns metadata that's related to the images in a repository in a public registry
<code>describe_image_tags</code>	Returns the image tag details for a repository in a public registry
<code>describe_registries</code>	Returns details for a public registry
<code>describe_repositories</code>	Describes repositories that are in a public registry
<code>get_authorization_token</code>	Retrieves an authorization token
<code>get_registry_catalog_data</code>	Retrieves catalog metadata for a public registry
<code>get_repository_catalog_data</code>	Retrieve catalog metadata for a repository in a public registry
<code>get_repository_policy</code>	Retrieves the repository policy for the specified repository
<code>initiate_layer_upload</code>	Notifies Amazon ECR that you intend to upload an image layer
<code>list_tags_for_resource</code>	List the tags for an Amazon ECR Public resource
<code>put_image</code>	Creates or updates the image manifest and tags that are associated with an image
<code>put_registry_catalog_data</code>	Create or update the catalog data for a public registry
<code>put_repository_catalog_data</code>	Creates or updates the catalog data for a repository in a public registry
<code>set_repository_policy</code>	Applies a repository policy to the specified public repository to control access permissions
<code>tag_resource</code>	Associates the specified tags to a resource with the specified resourceArn
<code>untag_resource</code>	Deletes specified tags from a resource
<code>upload_layer_part</code>	Uploads an image layer part to Amazon ECR

Examples

```
## Not run:
svc <- ecrpublic()
svc$batch_check_layer_availability(
  Foo = 123
)

## End(Not run)
```

Description

Amazon Elastic Container Service

Amazon Elastic Container Service (Amazon ECS) is a highly scalable, fast, container management service. It makes it easy to run, stop, and manage Docker containers. You can host your cluster on a serverless infrastructure that's managed by Amazon ECS by launching your services or tasks on

Fargate. For more control, you can host your tasks on a cluster of Amazon Elastic Compute Cloud (Amazon EC2) or External (on-premises) instances that you manage.

Amazon ECS makes it easy to launch and stop container-based applications with simple API calls. This makes it easy to get the state of your cluster from a centralized service, and gives you access to many familiar Amazon EC2 features.

You can use Amazon ECS to schedule the placement of containers across your cluster based on your resource needs, isolation policies, and availability requirements. With Amazon ECS, you don't need to operate your own cluster management and configuration management systems. You also don't need to worry about scaling your management infrastructure.

Usage

```
ecs(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- ecs(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

create_capacity_provider	Creates a new capacity provider
create_cluster	Creates a new Amazon ECS cluster
create_service	Runs and maintains your desired number of tasks from a specified task definition
create_task_set	Create a task set in the specified cluster and service
delete_account_setting	Disables an account setting for a specified user, role, or the root user for an account
delete_attributes	Deletes one or more custom attributes from an Amazon ECS resource
delete_capacity_provider	Deletes the specified capacity provider
delete_cluster	Deletes the specified cluster

delete_service	Deletes a specified service within a cluster
delete_task_definitions	Deletes one or more task definitions
delete_task_set	Deletes a specified task set within a service
deregister_container_instance	Deregisters an Amazon ECS container instance from the specified cluster
deregister_task_definition	Deregisters the specified task definition by family and revision
describe_capacity_providers	Describes one or more of your capacity providers
describe_clusters	Describes one or more of your clusters
describe_container_instances	Describes one or more container instances
describe_services	Describes the specified services running in your cluster
describe_task_definition	Describes a task definition
describe_tasks	Describes a specified task or tasks
describe_task_sets	Describes the task sets in the specified cluster and service
discover_poll_endpoint	This action is only used by the Amazon ECS agent, and it is not intended for use outside
execute_command	Runs a command remotely on a container within a task
get_task_protection	Retrieves the protection status of tasks in an Amazon ECS service
list_account_settings	Lists the account settings for a specified principal
list_attributes	Lists the attributes for Amazon ECS resources within a specified target type and cluster
list_clusters	Returns a list of existing clusters
list_container_instances	Returns a list of container instances in a specified cluster
list_services	Returns a list of services
list_services_by_namespace	This operation lists all of the services that are associated with a Cloud Map namespace
list_tags_for_resource	List the tags for an Amazon ECS resource
list_task_definition_families	Returns a list of task definition families that are registered to your account
list_task_definitions	Returns a list of task definitions that are registered to your account
list_tasks	Returns a list of tasks
put_account_setting	Modifies an account setting
put_account_setting_default	Modifies an account setting for all users on an account for whom no individual account s
put_attributes	Create or update an attribute on an Amazon ECS resource
put_cluster_capacity_providers	Modifies the available capacity providers and the default capacity provider strategy for a
register_container_instance	This action is only used by the Amazon ECS agent, and it is not intended for use outside
register_task_definition	Registers a new task definition from the supplied family and containerDefinitions
run_task	Starts a new task using the specified task definition
start_task	Starts a new task from the specified task definition on the specified container instance or i
stop_task	Stops a running task
submit_attachment_state_changes	This action is only used by the Amazon ECS agent, and it is not intended for use outside
submit_container_state_change	This action is only used by the Amazon ECS agent, and it is not intended for use outside
submit_task_state_change	This action is only used by the Amazon ECS agent, and it is not intended for use outside
tag_resource	Associates the specified tags to a resource with the specified resourceArn
untag_resource	Deletes specified tags from a resource
update_capacity_provider	Modifies the parameters for a capacity provider
update_cluster	Updates the cluster
update_cluster_settings	Modifies the settings to use for a cluster
update_container_agent	Updates the Amazon ECS container agent on a specified container instance
update_container_instances_state	Modifies the status of an Amazon ECS container instance
update_service	Modifies the parameters of a service
update_service_primary_task_set	Modifies which task set in a service is the primary task set
update_task_protection	Updates the protection status of a task
update_task_set	Modifies a task set

Examples

```
## Not run:
svc <- ecs()
# This example creates a cluster in your default region.
svc$create_cluster(
  clusterName = "my_cluster"
)

## End(Not run)
```

 eks

Amazon Elastic Kubernetes Service

Description

Amazon Elastic Kubernetes Service (Amazon EKS) is a managed service that makes it easy for you to run Kubernetes on Amazon Web Services without needing to setup or maintain your own Kubernetes control plane. Kubernetes is an open-source system for automating the deployment, scaling, and management of containerized applications.

Amazon EKS runs up-to-date versions of the open-source Kubernetes software, so you can use all the existing plugins and tooling from the Kubernetes community. Applications running on Amazon EKS are fully compatible with applications running on any standard Kubernetes environment, whether running in on-premises data centers or public clouds. This means that you can easily migrate any standard Kubernetes application to Amazon EKS without any code modification required.

Usage

```
eks(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **credentials:**
 - **creds:**
 - * **access_key_id:** AWS access key ID
 - * **secret_access_key:** AWS secret access key
 - * **session_token:** AWS temporary session token
 - **profile:** The name of a profile to use. If not given, then the default profile is used.
 - **anonymous:** Set anonymous credentials.
- **endpoint:** The complete URL to use for the constructed client.
- **region:** The AWS Region used in instantiating the client.

	<ul style="list-style-type: none"> • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	<p>Optional credentials shorthand for the config parameter</p> <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- eks(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
```

```

    creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
),
endpoint = "string",
region = "string"
)

```

Operations

associate_access_policy	Associates an access policy and its scope to an access entry
associate_encryption_config	Associates an encryption configuration to an existing cluster
associate_identity_provider_config	Associates an identity provider configuration to a cluster
create_access_entry	Creates an access entry
create_addon	Creates an Amazon EKS add-on
create_cluster	Creates an Amazon EKS control plane
create_eks_anywhere_subscription	Creates an EKS Anywhere subscription
create_fargate_profile	Creates an Fargate profile for your Amazon EKS cluster
create_nodegroup	Creates a managed node group for an Amazon EKS cluster
create_pod_identity_association	Creates an EKS Pod Identity association between a service account in an Amazon EK
delete_access_entry	Deletes an access entry
delete_addon	Deletes an Amazon EKS add-on
delete_cluster	Deletes an Amazon EKS cluster control plane
delete_eks_anywhere_subscription	Deletes an expired or inactive subscription
delete_fargate_profile	Deletes an Fargate profile
delete_nodegroup	Deletes a managed node group
delete_pod_identity_association	Deletes a EKS Pod Identity association
deregister_cluster	Deregisters a connected cluster to remove it from the Amazon EKS control plane
describe_access_entry	Describes an access entry
describe_addon	Describes an Amazon EKS add-on
describe_addon_configuration	Returns configuration options
describe_addon_versions	Describes the versions for an add-on
describe_cluster	Describes an Amazon EKS cluster
describe_eks_anywhere_subscription	Returns descriptive information about a subscription
describe_fargate_profile	Describes an Fargate profile
describe_identity_provider_config	Describes an identity provider configuration
describe_insight	Returns details about an insight that you specify using its ID
describe_nodegroup	Describes a managed node group
describe_pod_identity_association	Returns descriptive information about an EKS Pod Identity association
describe_update	Describes an update to an Amazon EKS resource
disassociate_access_policy	Disassociates an access policy from an access entry
disassociate_identity_provider_config	Disassociates an identity provider configuration from a cluster
list_access_entries	Lists the access entries for your cluster
list_access_policies	Lists the available access policies

list_addons	Lists the installed add-ons
list_associated_access_policies	Lists the access policies associated with an access entry
list_clusters	Lists the Amazon EKS clusters in your Amazon Web Services account in the specified region
list_eks_anywhere_subscriptions	Displays the full description of the subscription
list_fargate_profiles	Lists the Fargate profiles associated with the specified cluster in your Amazon Web Services account
list_identity_provider_configs	Lists the identity provider configurations for your cluster
list_insights	Returns a list of all insights checked for against the specified cluster
list_nodegroups	Lists the managed node groups associated with the specified cluster in your Amazon Web Services account
list_pod_identity_associations	List the EKS Pod Identity associations in a cluster
list_tags_for_resource	List the tags for an Amazon EKS resource
list_updates	Lists the updates associated with an Amazon EKS resource in your Amazon Web Services account
register_cluster	Connects a Kubernetes cluster to the Amazon EKS control plane
tag_resource	Associates the specified tags to an Amazon EKS resource with the specified resource ID
untag_resource	Deletes specified tags from an Amazon EKS resource
update_access_entry	Updates an access entry
update_addon	Updates an Amazon EKS add-on
update_cluster_config	Updates an Amazon EKS cluster configuration
update_cluster_version	Updates an Amazon EKS cluster to the specified Kubernetes version
update_eks_anywhere_subscription	Update an EKS Anywhere Subscription
update_nodegroup_config	Updates an Amazon EKS managed node group configuration
update_nodegroup_version	Updates the Kubernetes version or AMI version of an Amazon EKS managed node group
update_pod_identity_association	Updates a EKS Pod Identity association

Examples

```
## Not run:
svc <- eks()
# The following example creates an Amazon EKS cluster called prod.
svc$create_cluster(
  version = "1.10",
  name = "prod",
  clientRequestToken = "1d2129a1-3d38-460a-9756-e5b91fddb951",
  resourcesVpcConfig = list(
    securityGroupIds = list(
      "sg-6979fe18"
    ),
    subnetIds = list(
      "subnet-6782e71e",
      "subnet-e7e761ac"
    )
  ),
  roleArn = "arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRole..."
)

## End(Not run)
```

elasticbeanstalk	<i>AWS Elastic Beanstalk</i>
------------------	------------------------------

Description

AWS Elastic Beanstalk makes it easy for you to create, deploy, and manage scalable, fault-tolerant applications running on the Amazon Web Services cloud.

For more information about this product, go to the [AWS Elastic Beanstalk](#) details page. The location of the latest AWS Elastic Beanstalk WSDL is <https://elasticbeanstalk.s3.amazonaws.com/doc/2010-12-01/AWSElasticBeanstalk.wsdl>. To install the Software Development Kits (SDKs), Integrated Development Environment (IDE) Toolkits, and command line tools that enable you to access the API, go to [Tools for Amazon Web Services](#).

Endpoints

For a list of region-specific endpoints that AWS Elastic Beanstalk supports, go to [Regions and Endpoints](#) in the *Amazon Web Services Glossary*.

Usage

```
elasticbeanstalk(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>.
--------	---

	<ul style="list-style-type: none"> • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	<p>Optional credentials shorthand for the config parameter</p> <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- elasticbeanstalk(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
```

```

        anonymous = "logical"
    ),
    endpoint = "string",
    region = "string"
)

```

Operations

abort_environment_update	Cancels in-progress environment configuration update or application version update
apply_environment_managed_action	Applies a scheduled managed action immediately
associate_environment_operations_role	Add or change the operations role used by an environment
check_dns_availability	Checks if the specified CNAME is available
compose_environments	Create or update a group of environments that each run a separate component
create_application	Creates an application that has one configuration template named default
create_application_version	Creates an application version for the specified application
create_configuration_template	Creates an AWS Elastic Beanstalk configuration template, associated with a solution stack
create_environment	Launches an AWS Elastic Beanstalk environment for the specified application and configuration template
create_platform_version	Create a new version of your custom platform
create_storage_location	Creates a bucket in Amazon S3 to store application versions, logs, and other artifacts
delete_application	Deletes the specified application along with all associated versions and configurations
delete_application_version	Deletes the specified version from the specified application
delete_configuration_template	Deletes the specified configuration template
delete_environment_configuration	Deletes the draft configuration associated with the running environment
delete_platform_version	Deletes the specified version of a custom platform
describe_account_attributes	Returns attributes related to AWS Elastic Beanstalk that are associated with your account
describe_applications	Returns the descriptions of existing applications
describe_application_versions	Retrieve a list of application versions
describe_configuration_options	Describes the configuration options that are used in a particular configuration set
describe_configuration_settings	Returns a description of the settings for the specified configuration set, that can be used to create an environment
describe_environment_health	Returns information about the overall health of the specified environment
describe_environment_managed_action_history	Lists an environment's completed and failed managed actions
describe_environment_managed_actions	Lists an environment's upcoming and in-progress managed actions
describe_environment_resources	Returns AWS resources for this environment
describe_environments	Returns descriptions for existing environments
describe_events	Returns list of event descriptions matching criteria up to the last 6 weeks
describe_instances_health	Retrieves detailed information about the health of instances in your AWS Elastic Beanstalk environment
describe_platform_version	Describes a platform version
disassociate_environment_operations_role	Disassociate the operations role from an environment
list_available_solution_stacks	Returns a list of the available solution stack names, with the public version name
list_platform_branches	Lists the platform branches available for your account in an AWS Region
list_platform_versions	Lists the platform versions available for your account in an AWS Region
list_tags_for_resource	Return the tags applied to an AWS Elastic Beanstalk resource
rebuild_environment	Deletes and recreates all of the AWS resources (for example: the Auto Scaling group, EC2 instances, and Elastic Load Balancing load balancer)
request_environment_info	Initiates a request to compile the specified type of information of the deployment
restart_app_server	Causes the environment to restart the application container server running on the instances
retrieve_environment_info	Retrieves the compiled information from a RequestEnvironmentInfo request
swap_environment_cnames	Swaps the CNAMEs of two environments
terminate_environment	Terminates the specified environment

update_application	Updates the specified application to have the specified properties
update_application_resource_lifecycle	Modifies lifecycle settings for an application
update_application_version	Updates the specified application version to have the specified properties
update_configuration_template	Updates the specified configuration template to have the specified properties
update_environment	Updates the environment description, deploys a new application version, updates the application version
update_tags_for_resource	Update the list of tags applied to an AWS Elastic Beanstalk resource
validate_configuration_settings	Takes a set of configuration settings and either a configuration template or environment description

Examples

```
## Not run:
svc <- elasticbeanstalk()
# The following code aborts a running application version deployment for
# an environment named my-env:
svc$abort_environment_update(
  EnvironmentName = "my-env"
)

## End(Not run)
```

 emrcontainers

 Amazon EMR Containers

Description

Amazon EMR on EKS provides a deployment option for Amazon EMR that allows you to run open-source big data frameworks on Amazon Elastic Kubernetes Service (Amazon EKS). With this deployment option, you can focus on running analytics workloads while Amazon EMR on EKS builds, configures, and manages containers for open-source applications. For more information about Amazon EMR on EKS concepts and tasks, see [What is Amazon EMR on EKS](#).

Amazon EMR containers is the API name for Amazon EMR on EKS. The `emr-containers` prefix is used in the following scenarios:

- It is the prefix in the CLI commands for Amazon EMR on EKS. For example, `aws emr-containers start-job-run`.
- It is the prefix before IAM policy actions for Amazon EMR on EKS. For example, "Action": ["emr-containers:StartJobRun"]. For more information, see [Policy actions for Amazon EMR on EKS](#).
- It is the prefix used in Amazon EMR on EKS service endpoints. For example, `emr-containers.us-east-2.amazonaws.com`. For more information, see [Amazon EMR on EKSService Endpoints](#).

Usage

```
emrcontainers(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```

svc <- emrcontainers(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)

```

Operations

cancel_job_run	Cancel a job run
create_job_template	Create a job template
create_managed_endpoint	Create a managed endpoint
create_security_configuration	Create a security configuration
create_virtual_cluster	Create a virtual cluster
delete_job_template	Delete a job template
delete_managed_endpoint	Delete a managed endpoint
delete_virtual_cluster	Delete a virtual cluster
describe_job_run	Display detailed information about a job run
describe_job_template	Display detailed information about a specified job template
describe_managed_endpoint	Display detailed information about a managed endpoint
describe_security_configuration	Display detailed information about a specified security configuration
describe_virtual_cluster	Display detailed information about a specified virtual cluster

get_managed_endpoint_session_credentials	Generate a session token to connect to a managed endpoint
list_job_runs	Lists job runs based on a set of parameters
list_job_templates	Lists job templates based on a set of parameters
list_managed_endpoints	Lists managed endpoints based on a set of parameters
list_security_configurations	Lists security configurations based on a set of parameters
list_tags_for_resource	Lists the tags assigned to the resources
list_virtual_clusters	Lists information about the specified virtual cluster
start_job_run	Starts a job run
tag_resource	Assigns tags to resources
untag_resource	Removes tags from resources

Examples

```
## Not run:
svc <- emrcontainers()
svc$cancel_job_run(
  Foo = 123
)

## End(Not run)
```

emrserverless

EMR Serverless

Description

Amazon EMR Serverless is a new deployment option for Amazon EMR. Amazon EMR Serverless provides a serverless runtime environment that simplifies running analytics applications using the latest open source frameworks such as Apache Spark and Apache Hive. With Amazon EMR Serverless, you don't have to configure, optimize, secure, or operate clusters to run applications with these frameworks.

The API reference to Amazon EMR Serverless is `emr-serverless`. The `emr-serverless` prefix is used in the following scenarios:

- It is the prefix in the CLI commands for Amazon EMR Serverless. For example, `aws emr-serverless start-job-run`.
- It is the prefix before IAM policy actions for Amazon EMR Serverless. For example, "Action": ["emr-serverless:S... For more information, see [Policy actions for Amazon EMR Serverless](#).
- It is the prefix used in Amazon EMR Serverless service endpoints. For example, `emr-serverless.us-east-2.amazonaws.com`.

Usage

```
emrserverless(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```

svc <- emrserverless(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)

```

Operations

cancel_job_run	Cancels a job run
create_application	Creates an application
delete_application	Deletes an application
get_application	Displays detailed information about a specified application
get_dashboard_for_job_run	Creates and returns a URL that you can use to access the application UIs for a job run
get_job_run	Displays detailed information about a job run
list_applications	Lists applications based on a set of parameters
list_job_run_attempts	Lists all attempt of a job run
list_job_runs	Lists job runs based on a set of parameters
list_tags_for_resource	Lists the tags assigned to the resources
start_application	Starts a specified application and initializes initial capacity if configured
start_job_run	Starts a job run
stop_application	Stops a specified application and releases initial capacity if configured

tag_resource	Assigns tags to resources
untag_resource	Removes tags from resources
update_application	Updates a specified application

Examples

```
## Not run:
svc <- emrserverless()
svc$cancel_job_run(
  Foo = 123
)

## End(Not run)
```

imagebuilder	<i>EC2 Image Builder</i>
--------------	--------------------------

Description

EC2 Image Builder is a fully managed Amazon Web Services service that makes it easier to automate the creation, management, and deployment of customized, secure, and up-to-date "golden" server images that are pre-installed and pre-configured with software and settings to meet specific IT standards.

Usage

```
imagebuilder(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

- **credentials:**
 - **creds:**
 - * **access_key_id:** AWS access key ID
 - * **secret_access_key:** AWS secret access key
 - * **session_token:** AWS temporary session token
 - **profile:** The name of a profile to use. If not given, then the default profile is used.

	<ul style="list-style-type: none"> – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- imagebuilder(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
```

```

        sts_regional_endpoint = "string"
    ),
    credentials = list(
        creds = list(
            access_key_id = "string",
            secret_access_key = "string",
            session_token = "string"
        ),
        profile = "string",
        anonymous = "logical"
    ),
    endpoint = "string",
    region = "string"
)

```

Operations

cancel_image_creation	CancelImageCreation cancels the creation of Image
cancel_lifecycle_execution	Cancel a specific image lifecycle policy runtime instance
create_component	Creates a new component that can be used to build, validate, test, and assess your ima
create_container_recipe	Creates a new container recipe
create_distribution_configuration	Creates a new distribution configuration
create_image	Creates a new image
create_image_pipeline	Creates a new image pipeline
create_image_recipe	Creates a new image recipe
create_infrastructure_configuration	Creates a new infrastructure configuration
create_lifecycle_policy	Create a lifecycle policy resource
create_workflow	Create a new workflow or a new version of an existing workflow
delete_component	Deletes a component build version
delete_container_recipe	Deletes a container recipe
delete_distribution_configuration	Deletes a distribution configuration
delete_image	Deletes an Image Builder image resource
delete_image_pipeline	Deletes an image pipeline
delete_image_recipe	Deletes an image recipe
delete_infrastructure_configuration	Deletes an infrastructure configuration
delete_lifecycle_policy	Delete the specified lifecycle policy resource
delete_workflow	Deletes a specific workflow resource
get_component	Gets a component object
get_component_policy	Gets a component policy
get_container_recipe	Retrieves a container recipe
get_container_recipe_policy	Retrieves the policy for a container recipe
get_distribution_configuration	Gets a distribution configuration
get_image	Gets an image
get_image_pipeline	Gets an image pipeline
get_image_policy	Gets an image policy
get_image_recipe	Gets an image recipe
get_image_recipe_policy	Gets an image recipe policy
get_infrastructure_configuration	Gets an infrastructure configuration

get_lifecycle_execution	Get the runtime information that was logged for a specific runtime instance of the lifecycle
get_lifecycle_policy	Get details for the specified image lifecycle policy
get_workflow	Get a workflow resource object
get_workflow_execution	Get the runtime information that was logged for a specific runtime instance of the workflow
get_workflow_step_execution	Get the runtime information that was logged for a specific runtime instance of the workflow step
import_component	Imports a component and transforms its data into a component document
import_vm_image	When you export your virtual machine (VM) from its virtualization environment, this operation imports the VM as an image
list_component_build_versions	Returns the list of component build versions for the specified semantic version
list_components	Returns the list of components that can be filtered by name, or by using the listed filters
list_container_recipes	Returns a list of container recipes
list_distribution_configurations	Returns a list of distribution configurations
list_image_build_versions	Returns a list of image build versions
list_image_packages	List the Packages that are associated with an Image Build Version, as determined by the specified build version
list_image_pipeline_images	Returns a list of images created by the specified pipeline
list_image_pipelines	Returns a list of image pipelines
list_image_recipes	Returns a list of image recipes
list_images	Returns the list of images that you have access to
list_image_scan_finding_aggregations	Returns a list of image scan aggregations for your account
list_image_scan_findings	Returns a list of image scan findings for your account
list_infrastructure_configurations	Returns a list of infrastructure configurations
list_lifecycle_execution_resources	List resources that the runtime instance of the image lifecycle identified for lifecycle
list_lifecycle_executions	Get the lifecycle runtime history for the specified resource
list_lifecycle_policies	Get a list of lifecycle policies in your Amazon Web Services account
list_tags_for_resource	Returns the list of tags for the specified resource
list_waiting_workflow_steps	Get a list of workflow steps that are waiting for action for workflows in your Amazon Web Services account
list_workflow_build_versions	Returns a list of build versions for a specific workflow resource
list_workflow_executions	Returns a list of workflow runtime instance metadata objects for a specific image build version
list_workflows	Lists workflow build versions based on filtering parameters
list_workflow_step_executions	Returns runtime data for each step in a runtime instance of the workflow that you specify
put_component_policy	Applies a policy to a component
put_container_recipe_policy	Applies a policy to a container image
put_image_policy	Applies a policy to an image
put_image_recipe_policy	Applies a policy to an image recipe
send_workflow_step_action	Pauses or resumes image creation when the associated workflow runs a WaitForAction step
start_image_pipeline_execution	Manually triggers a pipeline to create an image
start_resource_state_update	Begin asynchronous resource state update for lifecycle changes to the specified image
tag_resource	Adds a tag to a resource
untag_resource	Removes a tag from a resource
update_distribution_configuration	Updates a new distribution configuration
update_image_pipeline	Updates an image pipeline
update_infrastructure_configuration	Updates a new infrastructure configuration
update_lifecycle_policy	Update the specified lifecycle policy

Examples

```
## Not run:
svc <- imagebuilder()
```

```
svc$cancel_image_creation(  
  Foo = 123  
)  
  
## End(Not run)
```

lambda

AWS Lambda

Description

Lambda

Overview

Lambda is a compute service that lets you run code without provisioning or managing servers. Lambda runs your code on a high-availability compute infrastructure and performs all of the administration of the compute resources, including server and operating system maintenance, capacity provisioning and automatic scaling, code monitoring and logging. With Lambda, you can run code for virtually any type of application or backend service. For more information about the Lambda service, see [What is Lambda](#) in the **Lambda Developer Guide**.

The *Lambda API Reference* provides information about each of the API methods, including details about the parameters in each API request and response.

You can use Software Development Kits (SDKs), Integrated Development Environment (IDE) Toolkits, and command line tools to access the API. For installation instructions, see [Tools for Amazon Web Services](#).

For a list of Region-specific endpoints that Lambda supports, see Lambda endpoints and quotas in the *Amazon Web Services General Reference*.

When making the API calls, you will need to authenticate your request by providing a signature. Lambda supports signature version 4. For more information, see [Signature Version 4 signing process](#) in the *Amazon Web Services General Reference*.

CA certificates

Because Amazon Web Services SDKs use the CA certificates from your computer, changes to the certificates on the Amazon Web Services servers can cause connection failures when you attempt to use an SDK. You can prevent these failures by keeping your computer's CA certificates and operating system up-to-date. If you encounter this issue in a corporate environment and do not manage your own computer, you might need to ask an administrator to assist with the update process. The following list shows minimum operating system and Java versions:

- Microsoft Windows versions that have updates from January 2005 or later installed contain at least one of the required CAs in their trust list.
- Mac OS X 10.4 with Java for Mac OS X 10.4 Release 5 (February 2007), Mac OS X 10.5 (October 2007), and later versions contain at least one of the required CAs in their trust list.
- Red Hat Enterprise Linux 5 (March 2007), 6, and 7 and CentOS 5, 6, and 7 all contain at least one of the required CAs in their default trusted CA list.

- Java 1.4.2_12 (May 2006), 5 Update 2 (March 2005), and all later versions, including Java 6 (December 2006), 7, and 8, contain at least one of the required CAs in their default trusted CA list.

When accessing the Lambda management console or Lambda API endpoints, whether through browsers or programmatically, you will need to ensure your client machines support any of the following CAs:

- Amazon Root CA 1
- Starfield Services Root Certificate Authority - G2
- Starfield Class 2 Certification Authority

Root certificates from the first two authorities are available from [Amazon trust services](#), but keeping your computer up-to-date is the more straightforward solution. To learn more about ACM-provided certificates, see [Amazon Web Services Certificate Manager FAQs](#).

Usage

```
lambda(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config	<p>Optional configuration of credentials, endpoint, and/or region.</p> <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	<p>Optional credentials shorthand for the config parameter</p> <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token

- **profile:** The name of a profile to use. If not given, then the default profile is used.
 - **anonymous:** Set anonymous credentials.
- endpoint Optional shorthand for complete URL to use for the constructed client.
- region Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- lambda(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

<code>add_layer_version_permission</code>	Adds permissions to the resource-based policy of a version of an Lambda layer
<code>add_permission</code>	Grants an Amazon Web Services service, Amazon Web Services account, or Amazon
<code>create_alias</code>	Creates an alias for a Lambda function version
<code>create_code_signing_config</code>	Creates a code signing configuration
<code>create_event_source_mapping</code>	Creates a mapping between an event source and an Lambda function
<code>create_function</code>	Creates a Lambda function
<code>create_function_url_config</code>	Creates a Lambda function URL with the specified configuration parameters
<code>delete_alias</code>	Deletes a Lambda function alias
<code>delete_code_signing_config</code>	Deletes the code signing configuration
<code>delete_event_source_mapping</code>	Deletes an event source mapping
<code>delete_function</code>	Deletes a Lambda function
<code>delete_function_code_signing_config</code>	Removes the code signing configuration from the function
<code>delete_function_concurrency</code>	Removes a concurrent execution limit from a function
<code>delete_function_event_invoke_config</code>	Deletes the configuration for asynchronous invocation for a function, version, or ali
<code>delete_function_url_config</code>	Deletes a Lambda function URL
<code>delete_layer_version</code>	Deletes a version of an Lambda layer
<code>delete_provisioned_concurrency_config</code>	Deletes the provisioned concurrency configuration for a function
<code>get_account_settings</code>	Retrieves details about your account's limits and usage in an Amazon Web Services
<code>get_alias</code>	Returns details about a Lambda function alias
<code>get_code_signing_config</code>	Returns information about the specified code signing configuration
<code>get_event_source_mapping</code>	Returns details about an event source mapping
<code>get_function</code>	Returns information about the function or function version, with a link to download
<code>get_function_code_signing_config</code>	Returns the code signing configuration for the specified function
<code>get_function_concurrency</code>	Returns details about the reserved concurrency configuration for a function
<code>get_function_configuration</code>	Returns the version-specific settings of a Lambda function or version
<code>get_function_event_invoke_config</code>	Retrieves the configuration for asynchronous invocation for a function, version, or a
<code>get_function_recursion_config</code>	Returns your function's recursive loop detection configuration
<code>get_function_url_config</code>	Returns details about a Lambda function URL
<code>get_layer_version</code>	Returns information about a version of an Lambda layer, with a link to download th
<code>get_layer_version_by_arn</code>	Returns information about a version of an Lambda layer, with a link to download th
<code>get_layer_version_policy</code>	Returns the permission policy for a version of an Lambda layer
<code>get_policy</code>	Returns the resource-based IAM policy for a function, version, or alias
<code>get_provisioned_concurrency_config</code>	Retrieves the provisioned concurrency configuration for a function's alias or version
<code>get_runtime_management_config</code>	Retrieves the runtime management configuration for a function's version
<code>invoke</code>	Invokes a Lambda function
<code>invoke_async</code>	For asynchronous function invocation, use Invoke
<code>invoke_with_response_stream</code>	Configure your Lambda functions to stream response payloads back to clients
<code>list_aliases</code>	Returns a list of aliases for a Lambda function
<code>list_code_signing_configs</code>	Returns a list of code signing configurations
<code>list_event_source_mappings</code>	Lists event source mappings
<code>list_function_event_invoke_configs</code>	Retrieves a list of configurations for asynchronous invocation for a function
<code>list_functions</code>	Returns a list of Lambda functions, with the version-specific configuration of each
<code>list_functions_by_code_signing_config</code>	List the functions that use the specified code signing configuration
<code>list_function_url_configs</code>	Returns a list of Lambda function URLs for the specified function
<code>list_layers</code>	Lists Lambda layers and shows information about the latest version of each
<code>list_layer_versions</code>	Lists the versions of an Lambda layer
<code>list_provisioned_concurrency_configs</code>	Retrieves a list of provisioned concurrency configurations for a function
<code>list_tags</code>	Returns a function's tags

list_versions_by_function	Returns a list of versions, with the version-specific configuration of each
publish_layer_version	Creates an Lambda layer from a ZIP archive
publish_version	Creates a version from the current code and configuration of a function
put_function_code_signing_config	Update the code signing configuration for the function
put_function_concurrency	Sets the maximum number of simultaneous executions for a function, and reserves
put_function_event_invoke_config	Configures options for asynchronous invocation on a function, version, or alias
put_function_recursion_config	Sets your function's recursive loop detection configuration
put_provisioned_concurrency_config	Adds a provisioned concurrency configuration to a function's alias or version
put_runtime_management_config	Sets the runtime management configuration for a function's version
remove_layer_version_permission	Removes a statement from the permissions policy for a version of an Lambda layer
remove_permission	Revokes function-use permission from an Amazon Web Services service or another
tag_resource	Adds tags to a function
untag_resource	Removes tags from a function
update_alias	Updates the configuration of a Lambda function alias
update_code_signing_config	Update the code signing configuration
update_event_source_mapping	Updates an event source mapping
update_function_code	Updates a Lambda function's code
update_function_configuration	Modify the version-specific settings of a Lambda function
update_function_event_invoke_config	Updates the configuration for asynchronous invocation for a function, version, or al
update_function_url_config	Updates the configuration for a Lambda function URL

Examples

```
## Not run:
svc <- lambda()
svc$add_layer_version_permission(
  Foo = 123
)

## End(Not run)
```

lightsail

Amazon Lightsail

Description

Amazon Lightsail is the easiest way to get started with Amazon Web Services (Amazon Web Services) for developers who need to build websites or web applications. It includes everything you need to launch your project quickly - instances (virtual private servers), container services, storage buckets, managed databases, SSD-based block storage, static IP addresses, load balancers, content delivery network (CDN) distributions, DNS management of registered domains, and resource snapshots (backups) - for a low, predictable monthly price.

You can manage your Lightsail resources using the Lightsail console, Lightsail API, Command Line Interface (CLI), or SDKs. For more information about Lightsail concepts and tasks, see the [Amazon Lightsail Developer Guide](#).

This API Reference provides detailed information about the actions, data types, parameters, and errors of the Lightsail service. For more information about the supported Amazon Web Services Regions, endpoints, and service quotas of the Lightsail service, see [Amazon Lightsail Endpoints and Quotas](#) in the *Amazon Web Services General Reference*.

Usage

```
lightsail(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- lightsail(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

[allocate_static_ip](#)

[attach_certificate_to_distribution](#)

[attach_disk](#)

[attach_instances_to_load_balancer](#)

[attach_load_balancer_tls_certificate](#)

[attach_static_ip](#)

[close_instance_public_ports](#)

[copy_snapshot](#)

Allocates a static IP address

Attaches an SSL/TLS certificate to your Amazon Lightsail content delivery

Attaches a block storage disk to a running or stopped Lightsail instance and

Attaches one or more Lightsail instances to a load balancer

Attaches a Transport Layer Security (TLS) certificate to your load balancer

Attaches a static IP address to a specific Amazon Lightsail instance

Closes ports for a specific Amazon Lightsail instance

Copies a manual snapshot of an instance or disk as another manual snapsho

<code>create_bucket</code>	Creates an Amazon Lightsail bucket
<code>create_bucket_access_key</code>	Creates a new access key for the specified Amazon Lightsail bucket
<code>create_certificate</code>	Creates an SSL/TLS certificate for an Amazon Lightsail content delivery network
<code>create_cloud_formation_stack</code>	Creates an AWS CloudFormation stack, which creates a new Amazon EC2 instance
<code>create_contact_method</code>	Creates an email or SMS text message contact method
<code>create_container_service</code>	Creates an Amazon Lightsail container service
<code>create_container_service_deployment</code>	Creates a deployment for your Amazon Lightsail container service
<code>create_container_service_registry_login</code>	Creates a temporary set of log in credentials that you can use to log in to the container registry
<code>create_disk</code>	Creates a block storage disk that can be attached to an Amazon Lightsail instance
<code>create_disk_from_snapshot</code>	Creates a block storage disk from a manual or automatic snapshot of a disk
<code>create_disk_snapshot</code>	Creates a snapshot of a block storage disk
<code>create_distribution</code>	Creates an Amazon Lightsail content delivery network (CDN) distribution
<code>create_domain</code>	Creates a domain resource for the specified domain (example.com)
<code>create_domain_entry</code>	Creates one of the following domain name system (DNS) records in a domain: A, AAAA, CNAME, MX, NS, TXT, or SRV
<code>create_gui_session_access_details</code>	Creates two URLs that are used to access a virtual computer's graphical user interface
<code>create_instances</code>	Creates one or more Amazon Lightsail instances
<code>create_instances_from_snapshot</code>	Creates one or more new instances from a manual or automatic snapshot of an instance
<code>create_instance_snapshot</code>	Creates a snapshot of a specific virtual private server, or instance
<code>create_key_pair</code>	Creates a custom SSH key pair that you can use with an Amazon Lightsail instance
<code>create_load_balancer</code>	Creates a Lightsail load balancer
<code>create_load_balancer_tls_certificate</code>	Creates an SSL/TLS certificate for an Amazon Lightsail load balancer
<code>create_relational_database</code>	Creates a new database in Amazon Lightsail
<code>create_relational_database_from_snapshot</code>	Creates a new database from an existing database snapshot in Amazon Lightsail
<code>create_relational_database_snapshot</code>	Creates a snapshot of your database in Amazon Lightsail
<code>delete_alarm</code>	Deletes an alarm
<code>delete_auto_snapshot</code>	Deletes an automatic snapshot of an instance or disk
<code>delete_bucket</code>	Deletes a Amazon Lightsail bucket
<code>delete_bucket_access_key</code>	Deletes an access key for the specified Amazon Lightsail bucket
<code>delete_certificate</code>	Deletes an SSL/TLS certificate for your Amazon Lightsail content delivery network
<code>delete_contact_method</code>	Deletes a contact method
<code>delete_container_image</code>	Deletes a container image that is registered to your Amazon Lightsail container service
<code>delete_container_service</code>	Deletes your Amazon Lightsail container service
<code>delete_disk</code>	Deletes the specified block storage disk
<code>delete_disk_snapshot</code>	Deletes the specified disk snapshot
<code>delete_distribution</code>	Deletes your Amazon Lightsail content delivery network (CDN) distribution
<code>delete_domain</code>	Deletes the specified domain recordset and all of its domain records
<code>delete_domain_entry</code>	Deletes a specific domain entry
<code>delete_instance</code>	Deletes an Amazon Lightsail instance
<code>delete_instance_snapshot</code>	Deletes a specific snapshot of a virtual private server (or instance)
<code>delete_key_pair</code>	Deletes the specified key pair by removing the public key from Amazon Lightsail
<code>delete_known_host_keys</code>	Deletes the known host key or certificate used by the Amazon Lightsail browser
<code>delete_load_balancer</code>	Deletes a Lightsail load balancer and all its associated SSL/TLS certificates
<code>delete_load_balancer_tls_certificate</code>	Deletes an SSL/TLS certificate associated with a Lightsail load balancer
<code>delete_relational_database</code>	Deletes a database in Amazon Lightsail
<code>delete_relational_database_snapshot</code>	Deletes a database snapshot in Amazon Lightsail
<code>detach_certificate_from_distribution</code>	Detaches an SSL/TLS certificate from your Amazon Lightsail content delivery network
<code>detach_disk</code>	Detaches a stopped block storage disk from a Lightsail instance
<code>detach_instances_from_load_balancer</code>	Detaches the specified instances from a Lightsail load balancer

detach_static_ip	Detaches a static IP from the Amazon Lightsail instance to which it is attached
disable_add_on	Disables an add-on for an Amazon Lightsail resource
download_default_key_pair	Downloads the regional Amazon Lightsail default key pair
enable_add_on	Enables or modifies an add-on for an Amazon Lightsail resource
export_snapshot	Exports an Amazon Lightsail instance or block storage disk snapshot to Amazon S3
get_active_names	Returns the names of all active (not deleted) resources
get_alarms	Returns information about the configured alarms
get_auto_snapshots	Returns the available automatic snapshots for an instance or disk
get_blueprints	Returns the list of available instance images, or blueprints
get_bucket_access_keys	Returns the existing access key IDs for the specified Amazon Lightsail bucket
get_bucket_bundles	Returns the bundles that you can apply to a Amazon Lightsail bucket
get_bucket_metric_data	Returns the data points of a specific metric for an Amazon Lightsail bucket
get_buckets	Returns information about one or more Amazon Lightsail buckets
get_bundles	Returns the bundles that you can apply to an Amazon Lightsail instance
get_certificates	Returns information about one or more Amazon Lightsail SSL/TLS certificates
get_cloud_formation_stack_records	Returns the CloudFormation stack record created as a result of the create cloudformation operation
get_contact_methods	Returns information about the configured contact methods
get_container_api_metadata	Returns information about Amazon Lightsail containers, such as the current version
get_container_images	Returns the container images that are registered to your Amazon Lightsail account
get_container_log	Returns the log events of a container of your Amazon Lightsail container service
get_container_service_deployments	Returns the deployments for your Amazon Lightsail container service
get_container_service_metric_data	Returns the data points of a specific metric of your Amazon Lightsail container service
get_container_service_powers	Returns the list of powers that can be specified for your Amazon Lightsail container service
get_container_services	Returns information about one or more of your Amazon Lightsail container services
get_cost_estimate	Retrieves information about the cost estimate for a specified resource
get_disk	Returns information about a specific block storage disk
get_disks	Returns information about all block storage disks in your AWS account and region
get_disk_snapshot	Returns information about a specific block storage disk snapshot
get_disk_snapshots	Returns information about all block storage disk snapshots in your AWS account and region
get_distribution_bundles	Returns the bundles that can be applied to your Amazon Lightsail content distribution
get_distribution_latest_cache_reset	Returns the timestamp and status of the last cache reset of a specific Amazon Lightsail content distribution
get_distribution_metric_data	Returns the data points of a specific metric for an Amazon Lightsail content distribution
get_distributions	Returns information about one or more of your Amazon Lightsail content distributions
get_domain	Returns information about a specific domain recordset
get_domains	Returns a list of all domains in the user's account
get_export_snapshot_records	Returns all export snapshot records created as a result of the export snapshot operation
get_instance	Returns information about a specific Amazon Lightsail instance, which is a virtual private server
get_instance_access_details	Returns temporary SSH keys you can use to connect to a specific virtual private server
get_instance_metric_data	Returns the data points for the specified Amazon Lightsail instance metric, such as CPU usage
get_instance_port_states	Returns the firewall port states for a specific Amazon Lightsail instance, the state of each port is either open or closed
get_instances	Returns information about all Amazon Lightsail virtual private servers, or instances
get_instance_snapshot	Returns information about a specific instance snapshot
get_instance_snapshots	Returns all instance snapshots for the user's account
get_instance_state	Returns the state of a specific instance
get_key_pair	Returns information about a specific key pair
get_key_pairs	Returns information about all key pairs in the user's account
get_load_balancer	Returns information about the specified Lightsail load balancer
get_load_balancer_metric_data	Returns information about health metrics for your Lightsail load balancer

<code>get_load_balancers</code>	Returns information about all load balancers in an account
<code>get_load_balancer_tls_certificates</code>	Returns information about the TLS certificates that are associated with the specified load balancer
<code>get_load_balancer_tls_policies</code>	Returns a list of TLS security policies that you can apply to Lightsail load balancers
<code>get_operation</code>	Returns information about a specific operation
<code>get_operations</code>	Returns information about all operations
<code>get_operations_for_resource</code>	Gets operations for a specific resource (an instance or a static IP)
<code>get_regions</code>	Returns a list of all valid regions for Amazon Lightsail
<code>get_relational_database</code>	Returns information about a specific database in Amazon Lightsail
<code>get_relational_database_blueprints</code>	Returns a list of available database blueprints in Amazon Lightsail
<code>get_relational_database_bundles</code>	Returns the list of bundles that are available in Amazon Lightsail
<code>get_relational_database_events</code>	Returns a list of events for a specific database in Amazon Lightsail
<code>get_relational_database_log_events</code>	Returns a list of log events for a database in Amazon Lightsail
<code>get_relational_database_log_streams</code>	Returns a list of available log streams for a specific database in Amazon Lightsail
<code>get_relational_database_master_user_password</code>	Returns the current, previous, or pending versions of the master user password for a database in Amazon Lightsail
<code>get_relational_database_metric_data</code>	Returns the data points of the specified metric for a database in Amazon Lightsail
<code>get_relational_database_parameters</code>	Returns all of the runtime parameters offered by the underlying database software
<code>get_relational_databases</code>	Returns information about all of your databases in Amazon Lightsail
<code>get_relational_database_snapshot</code>	Returns information about a specific database snapshot in Amazon Lightsail
<code>get_relational_database_snapshots</code>	Returns information about all of your database snapshots in Amazon Lightsail
<code>get_setup_history</code>	Returns detailed information for five of the most recent SetupInstanceHttpRequests
<code>get_static_ip</code>	Returns information about an Amazon Lightsail static IP
<code>get_static_ips</code>	Returns information about all static IPs in the user's account
<code>import_key_pair</code>	Imports a public SSH key from a specific key pair
<code>is_vpc_peered</code>	Returns a Boolean value indicating whether your Lightsail VPC is peered with the user's default VPC
<code>open_instance_public_ports</code>	Opens ports for a specific Amazon Lightsail instance, and specifies the IP address
<code>peer_vpc</code>	Peers the Lightsail VPC with the user's default VPC
<code>put_alarm</code>	Creates or updates an alarm, and associates it with the specified metric
<code>put_instance_public_ports</code>	Opens ports for a specific Amazon Lightsail instance, and specifies the IP address
<code>reboot_instance</code>	Restarts a specific instance
<code>reboot_relational_database</code>	Restarts a specific database in Amazon Lightsail
<code>register_container_image</code>	Registers a container image to your Amazon Lightsail container service
<code>release_static_ip</code>	Deletes a specific static IP from your account
<code>reset_distribution_cache</code>	Deletes currently cached content from your Amazon Lightsail content delivery network
<code>send_contact_method_verification</code>	Sends a verification request to an email contact method to ensure it's owned by you
<code>set_ip_address_type</code>	Sets the IP address type for an Amazon Lightsail resource
<code>set_resource_access_for_bucket</code>	Sets the Amazon Lightsail resources that can access the specified Lightsail bucket
<code>setup_instance_https</code>	Creates an SSL/TLS certificate that secures traffic for your website
<code>start_gui_session</code>	Initiates a graphical user interface (GUI) session that's used to access a virtual machine
<code>start_instance</code>	Starts a specific Amazon Lightsail instance from a stopped state
<code>start_relational_database</code>	Starts a specific database from a stopped state in Amazon Lightsail
<code>stop_gui_session</code>	Terminates a web-based NICE DCV session that's used to access a virtual machine
<code>stop_instance</code>	Stops a specific Amazon Lightsail instance that is currently running
<code>stop_relational_database</code>	Stops a specific database that is currently running in Amazon Lightsail
<code>tag_resource</code>	Adds one or more tags to the specified Amazon Lightsail resource
<code>test_alarm</code>	Tests an alarm by displaying a banner on the Amazon Lightsail console
<code>unpeer_vpc</code>	Unpeers the Lightsail VPC from the user's default VPC
<code>untag_resource</code>	Deletes the specified set of tag keys and their values from the specified Amazon Lightsail resource
<code>update_bucket</code>	Updates an existing Amazon Lightsail bucket

update_bucket_bundle	Updates the bundle, or storage plan, of an existing Amazon Lightsail bucket
update_container_service	Updates the configuration of your Amazon Lightsail container service, such as
update_distribution	Updates an existing Amazon Lightsail content delivery network (CDN) distribution
update_distribution_bundle	Updates the bundle of your Amazon Lightsail content delivery network (CDN)
update_domain_entry	Updates a domain recordset after it is created
update_instance_metadata_options	Modifies the Amazon Lightsail instance metadata parameters on a running instance
update_load_balancer_attribute	Updates the specified attribute for a load balancer
update_relational_database	Allows the update of one or more attributes of a database in Amazon Lightsail
update_relational_database_parameters	Allows the update of one or more parameters of a database in Amazon Lightsail

Examples

```
## Not run:
svc <- lightsail()
svc$allocate_static_ip(
  Foo = 123
)

## End(Not run)
```

 proton

 AWS Proton

Description

This is the Proton Service API Reference. It provides descriptions, syntax and usage examples for each of the [actions](#) and [data types](#) for the Proton service.

The documentation for each action shows the Query API request parameters and the XML response.

Alternatively, you can use the Amazon Web Services CLI to access an API. For more information, see the [Amazon Web Services Command Line Interface User Guide](#).

The Proton service is a two-pronged automation framework. Administrators create service templates to provide standardized infrastructure and deployment tooling for serverless and container based applications. Developers, in turn, select from the available service templates to automate their application or service deployments.

Because administrators define the infrastructure and tooling that Proton deploys and manages, they need permissions to use all of the listed API operations.

When developers select a specific infrastructure and tooling set, Proton deploys their applications. To monitor their applications that are running on Proton, developers need permissions to the service *create*, *list*, *update* and *delete* API operations and the service instance *list* and *update* API operations.

To learn more about Proton, see the [Proton User Guide](#).

Ensuring Idempotency

When you make a mutating API request, the request typically returns a result before the asynchronous workflows of the operation are complete. Operations might also time out or encounter other server issues before they're complete, even if the request already returned a result. This might make it difficult to determine whether the request succeeded. Moreover, you might need to retry the request multiple times to ensure that the operation completes successfully. However, if the original request and the subsequent retries are successful, the operation occurs multiple times. This means that you might create more resources than you intended.

Idempotency ensures that an API request action completes no more than one time. With an idempotent request, if the original request action completes successfully, any subsequent retries complete successfully without performing any further actions. However, the result might contain updated information, such as the current creation status.

The following lists of APIs are grouped according to methods that ensure idempotency.

Idempotent create APIs with a client token

The API actions in this list support idempotency with the use of a *client token*. The corresponding Amazon Web Services CLI commands also support idempotency using a client token. A client token is a unique, case-sensitive string of up to 64 ASCII characters. To make an idempotent API request using one of these actions, specify a client token in the request. We recommend that you *don't* reuse the same client token for other API requests. If you don't provide a client token for these APIs, a default client token is automatically provided by SDKs.

Given a request action that has succeeded:

If you retry the request using the same client token and the same parameters, the retry succeeds without performing any further actions other than returning the original resource detail data in the response.

If you retry the request using the same client token, but one or more of the parameters are different, the retry throws a `ValidationException` with an `IdempotentParameterMismatch` error.

Client tokens expire eight hours after a request is made. If you retry the request with the expired token, a new resource is created.

If the original resource is deleted and you retry the request, a new resource is created.

Idempotent create APIs with a client token:

- `CreateEnvironmentTemplateVersion`
- `CreateServiceTemplateVersion`
- `CreateEnvironmentAccountConnection`

Idempotent create APIs

Given a request action that has succeeded:

If you retry the request with an API from this group, and the original resource *hasn't* been modified, the retry succeeds without performing any further actions other than returning the original resource detail data in the response.

If the original resource has been modified, the retry throws a `ConflictException`.

If you retry with different input parameters, the retry throws a `ValidationException` with an `IdempotentParameterMismatch` error.

Idempotent create APIs:

- CreateEnvironmentTemplate
- CreateServiceTemplate
- CreateEnvironment
- CreateService

Idempotent delete APIs

Given a request action that has succeeded:

When you retry the request with an API from this group and the resource was deleted, its metadata is returned in the response.

If you retry and the resource doesn't exist, the response is empty.

In both cases, the retry succeeds.

Idempotent delete APIs:

- DeleteEnvironmentTemplate
- DeleteEnvironmentTemplateVersion
- DeleteServiceTemplate
- DeleteServiceTemplateVersion
- DeleteEnvironmentAccountConnection

Asynchronous idempotent delete APIs

Given a request action that has succeeded:

If you retry the request with an API from this group, if the original request delete operation status is DELETE_IN_PROGRESS, the retry returns the resource detail data in the response without performing any further actions.

If the original request delete operation is complete, a retry returns an empty response.

Asynchronous idempotent delete APIs:

- DeleteEnvironment
- DeleteService

Usage

```
proton(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

- | | |
|--------|---|
| config | Optional configuration of credentials, endpoint, and/or region. |
|--------|---|
- **credentials:**
 - **creds:**
 - * **access_key_id:** AWS access key ID
 - * **secret_access_key:** AWS secret access key
 - * **session_token:** AWS temporary session token
 - **profile:** The name of a profile to use. If not given, then the default profile is used.

	<ul style="list-style-type: none"> – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to <code>true</code> to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- proton(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
```

```

        sts_regional_endpoint = "string"
    ),
    credentials = list(
        creds = list(
            access_key_id = "string",
            secret_access_key = "string",
            session_token = "string"
        ),
        profile = "string",
        anonymous = "logical"
    ),
    endpoint = "string",
    region = "string"
)

```

get_resources_summary	Get counts of Proton resources
get_service	Get detailed data for a service
get_service_instance	Get detailed data for a service instance
get_service_instance_sync_status	Get the status of the synced service instance
get_service_sync_blocker_summary	Get detailed data for the service sync blocker summary
get_service_sync_config	Get detailed information for the service sync configuration
get_service_template	Get detailed data for a service template
get_service_template_version	Get detailed data for a major or minor version of a service template
get_template_sync_config	Get detail data for a template sync configuration
get_template_sync_status	Get the status of a template sync
list_component_outputs	Get a list of component Infrastructure as Code (IaC) outputs
list_component_provisioned_resources	List provisioned resources for a component with details
list_components	List components with summary data
list_deployments	List deployments
list_environment_account_connections	View a list of environment account connections
list_environment_outputs	List the infrastructure as code outputs for your environment
list_environment_provisioned_resources	List the provisioned resources for your environment
list_environments	List environments with detail data summaries
list_environment_templates	List environment templates
list_environment_template_versions	List major or minor versions of an environment template with detail data
list_repositories	List linked repositories with detail data
list_repository_sync_definitions	List repository sync definitions with detail data
list_service_instance_outputs	Get a list service of instance Infrastructure as Code (IaC) outputs
list_service_instance_provisioned_resources	List provisioned resources for a service instance with details
list_service_instances	List service instances with summary data
list_service_pipeline_outputs	Get a list of service pipeline Infrastructure as Code (IaC) outputs
list_service_pipeline_provisioned_resources	List provisioned resources for a service and pipeline with details
list_services	List services with summaries of detail data
list_service_templates	List service templates with detail data
list_service_template_versions	List major or minor versions of a service template with detail data
list_tags_for_resource	List tags for a resource
notify_resource_deployment_status_change	Notify Proton of status changes to a provisioned resource when you use self-managed resources
reject_environment_account_connection	In a management account, reject an environment account connection from another account
tag_resource	Tag a resource
untag_resource	Remove a customer tag from a resource
update_account_settings	Update Proton settings that are used for multiple services in the Amazon Web Services account
update_component	Update a component
update_environment	Update an environment
update_environment_account_connection	In an environment account, update an environment account connection to use a different account
update_environment_template	Update an environment template
update_environment_template_version	Update a major or minor version of an environment template

update_service	Edit a service description or use a spec to add and delete service instances
update_service_instance	Update a service instance
update_service_pipeline	Update the service pipeline
update_service_sync_blocker	Update the service sync blocker by resolving it
update_service_sync_config	Update the Proton Ops config file
update_service_template	Update a service template
update_service_template_version	Update a major or minor version of a service template
update_template_sync_config	Update template sync configuration parameters, except for the templateName a

Examples

```
## Not run:
svc <- proton()
svc$accept_environment_account_connection(
  Foo = 123
)

## End(Not run)
```

serverlessapplicationrepository

AWSServerlessApplicationRepository

Description

The AWS Serverless Application Repository makes it easy for developers and enterprises to quickly find and deploy serverless applications in the AWS Cloud. For more information about serverless applications, see [Serverless Computing and Applications](#) on the AWS website.

The AWS Serverless Application Repository is deeply integrated with the AWS Lambda console, so that developers of all levels can get started with serverless computing without needing to learn anything new. You can use category keywords to browse for applications such as web and mobile backends, data processing applications, or chatbots. You can also search for applications by name, publisher, or event source. To use an application, you simply choose it, configure any required fields, and deploy it with a few clicks.

You can also easily publish applications, sharing them publicly with the community at large, or privately within your team or across your organization. To publish a serverless application (or app), you can use the AWS Management Console, AWS Command Line Interface (AWS CLI), or AWS SDKs to upload the code. Along with the code, you upload a simple manifest file, also known as the AWS Serverless Application Model (AWS SAM) template. For more information about AWS SAM, see [AWS Serverless Application Model \(AWS SAM\)](#) on the AWS Labs GitHub repository.

The [AWS Serverless Application Repository Developer Guide](#) contains more information about the two developer experiences available:

- Consuming Applications – Browse for applications and view information about them, including source code and readme files. Also install, configure, and deploy applications of your choosing.

Publishing Applications – Configure and upload applications to make them available to other developers, and publish new versions of applications.

Usage

```
serverlessapplicationrepository(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config	Optional configuration of credentials, endpoint, and/or region. <ul style="list-style-type: none"> • credentials: <ul style="list-style-type: none"> – creds: <ul style="list-style-type: none"> * access_key_id: AWS access key ID * secret_access_key: AWS secret access key * session_token: AWS temporary session token – profile: The name of a profile to use. If not given, then the default profile is used. – anonymous: Set anonymous credentials. • endpoint: The complete URL to use for the constructed client. • region: The AWS Region used in instantiating the client. • close_connection: Immediately close all HTTP connections. • timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds. • s3_force_path_style: Set this to true to force the request to use path-style addressing, i.e. <code>http://s3.amazonaws.com/BUCKET/KEY</code>. • sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-endpoint.html
credentials	Optional credentials shorthand for the config parameter <ul style="list-style-type: none"> • creds: <ul style="list-style-type: none"> – access_key_id: AWS access key ID – secret_access_key: AWS secret access key – session_token: AWS temporary session token • profile: The name of a profile to use. If not given, then the default profile is used. • anonymous: Set anonymous credentials.
endpoint	Optional shorthand for complete URL to use for the constructed client.
region	Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- serverlessapplicationrepository(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

create_application	Creates an application, optionally including an AWS SAM file to create the first application
create_application_version	Creates an application version
create_cloud_formation_change_set	Creates an AWS CloudFormation change set for the given application
create_cloud_formation_template	Creates an AWS CloudFormation template
delete_application	Deletes the specified application
get_application	Gets the specified application
get_application_policy	Retrieves the policy for the application
get_cloud_formation_template	Gets the specified AWS CloudFormation template

list_application_dependencies	Retrieves the list of applications nested in the containing application
list_applications	Lists applications owned by the requester
list_application_versions	Lists versions for the specified application
put_application_policy	Sets the permission policy for an application
unshare_application	Unshares an application from an AWS Organization
update_application	Updates the specified application

Examples

```
## Not run:
svc <- serverlessapplicationrepository()
svc$create_application(
  Foo = 123
)

## End(Not run)
```
